

Artificial Neural Network Models of Stream Temperature and Fish in the Great Lakes

James E. McKenna, Jr. and an
army of colleagues, cooperators,
and collaborators

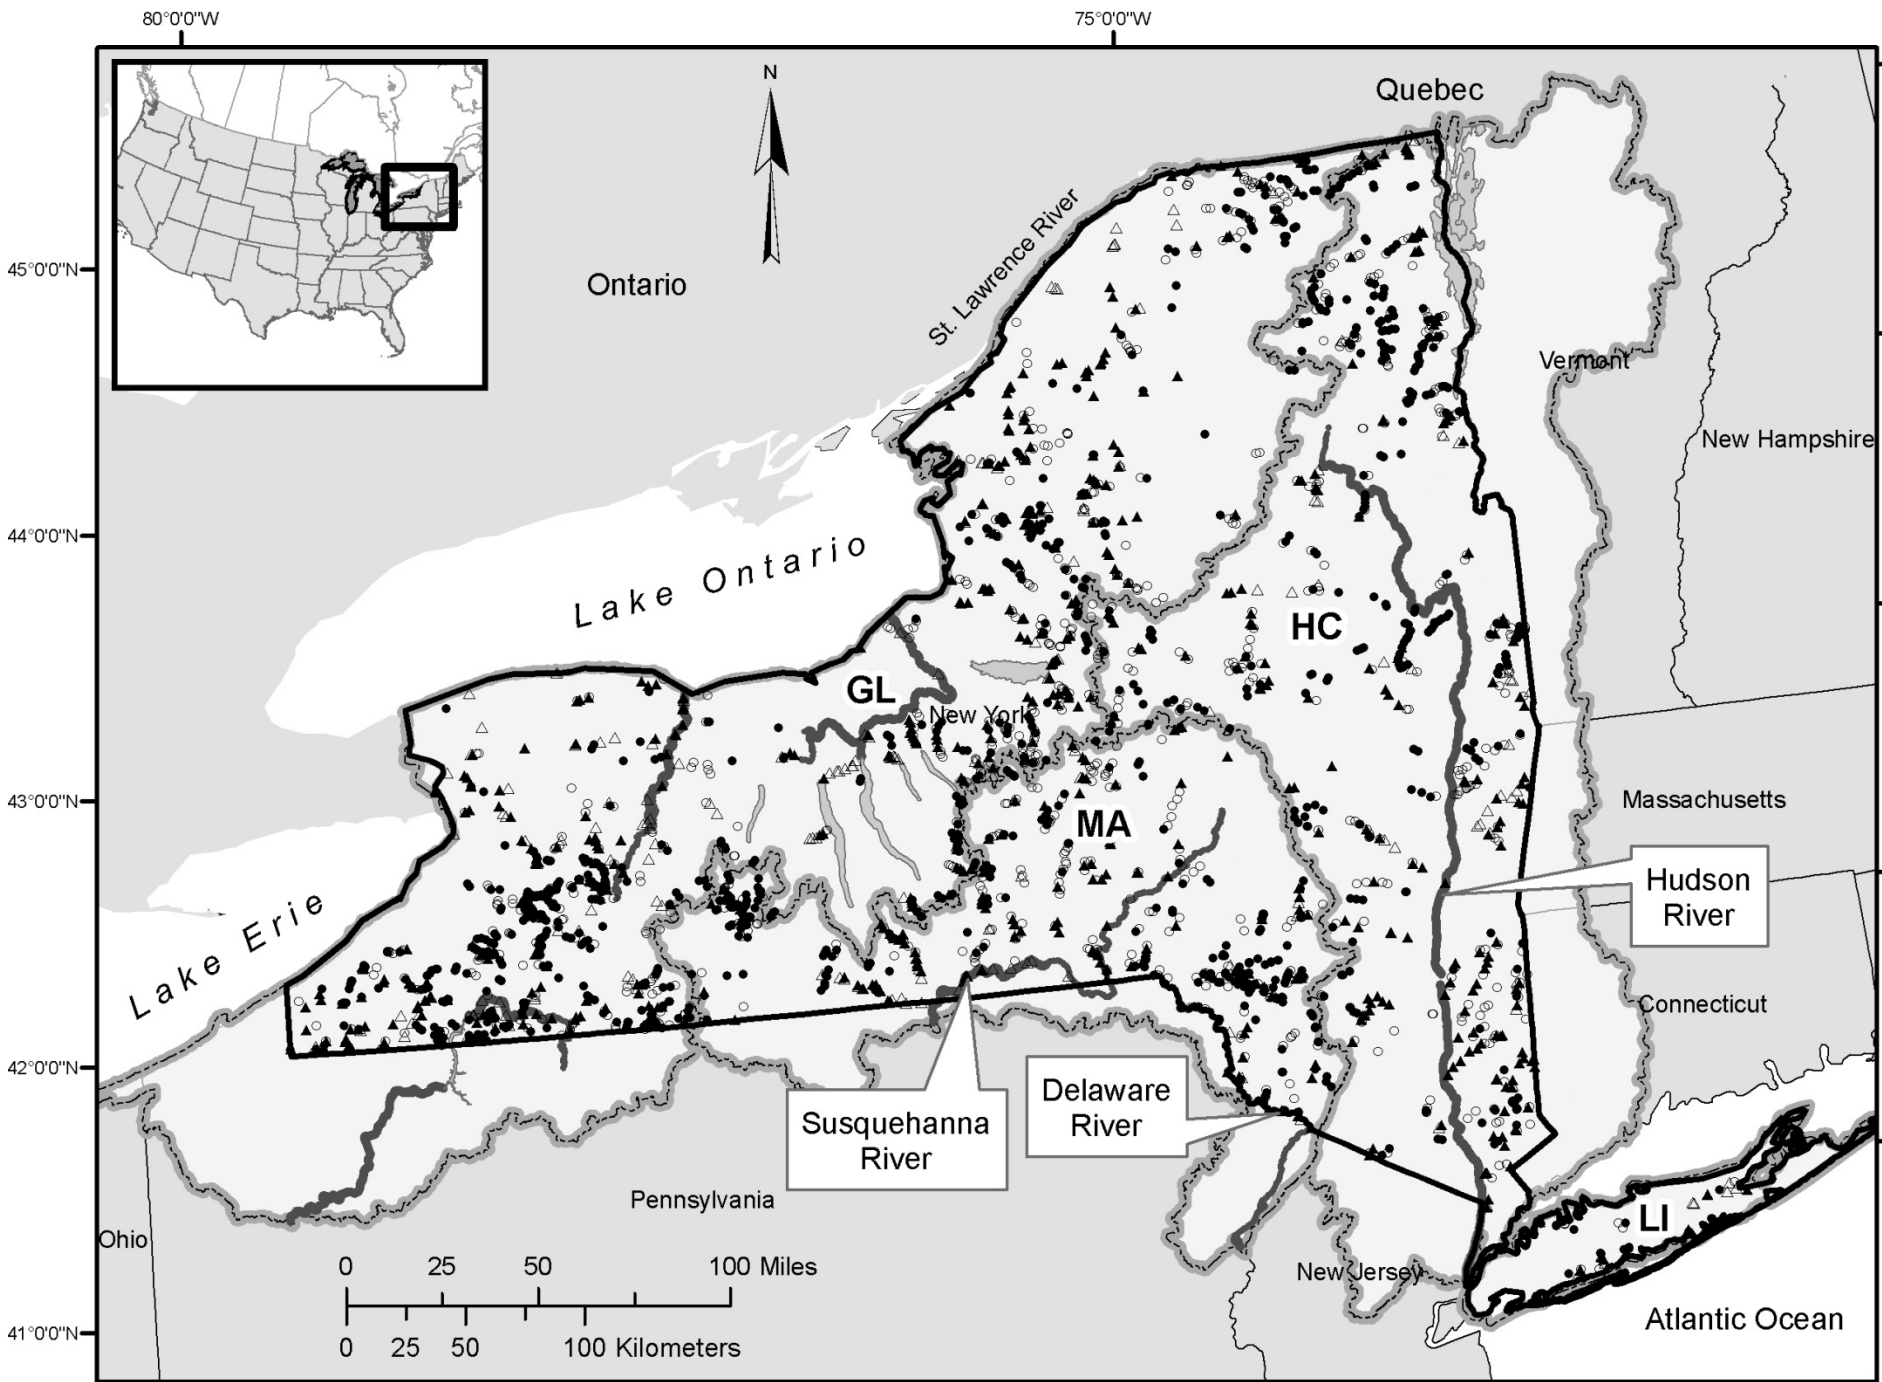

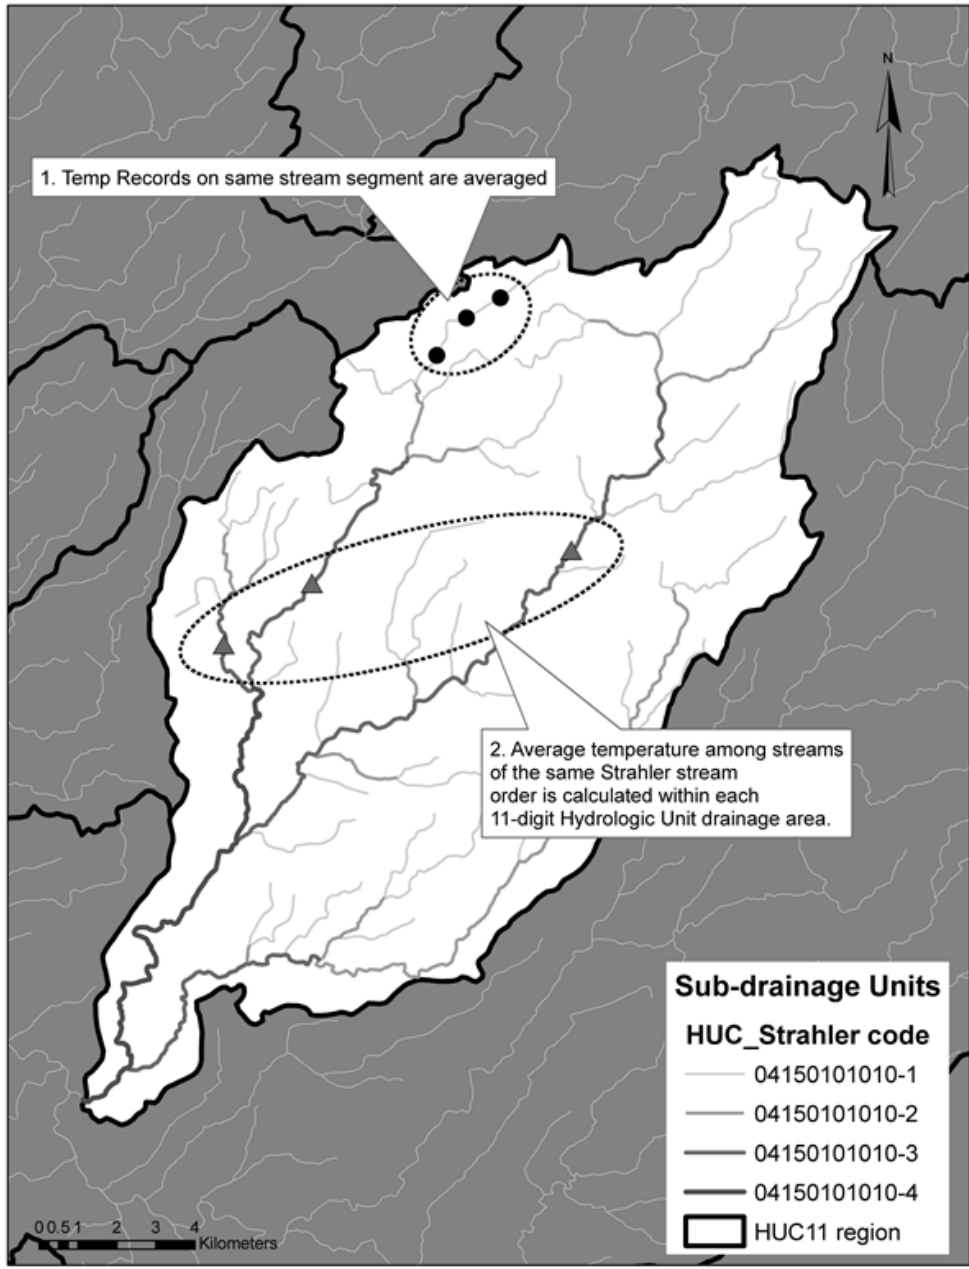

Habitat Variables Used as Model Predictors of Stream Temperature in New York

Influence Category	Landscape Variable
Groundwater holding/transporting bedrock	Sandstone or carbonate bedrock
Groundwater holding/transporting surficial geology (sand and gravel)	Sand and gravel layers
Land use influence on solar heating and evapotranspiration	Forest, agriculture, and open water coverage
Index of regional heat budget	Growing-degree Days
Stream geometry metrics	Stream size, elevation, and landscape slope

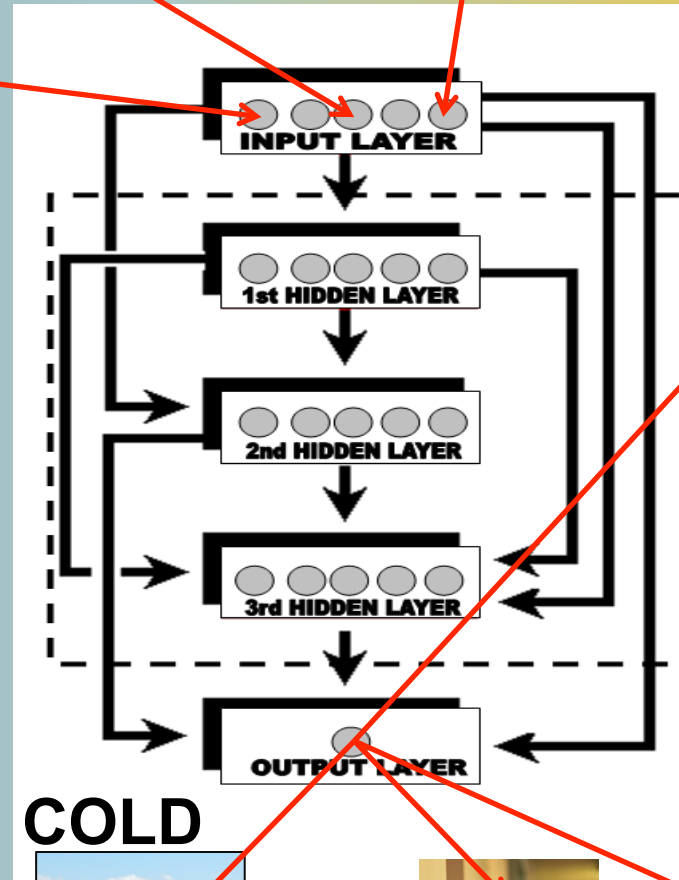

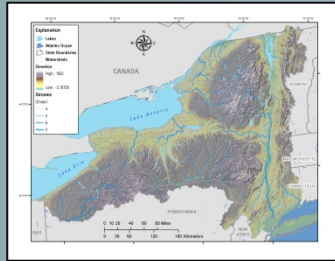

Predicting Water Temperature

Water Temperature Classes

Cold	Cool-	Warm-	Warm
	Transition	Transition	
<18°	18 - 20° C	21 - 23° C	>24° C

COLD

COOL

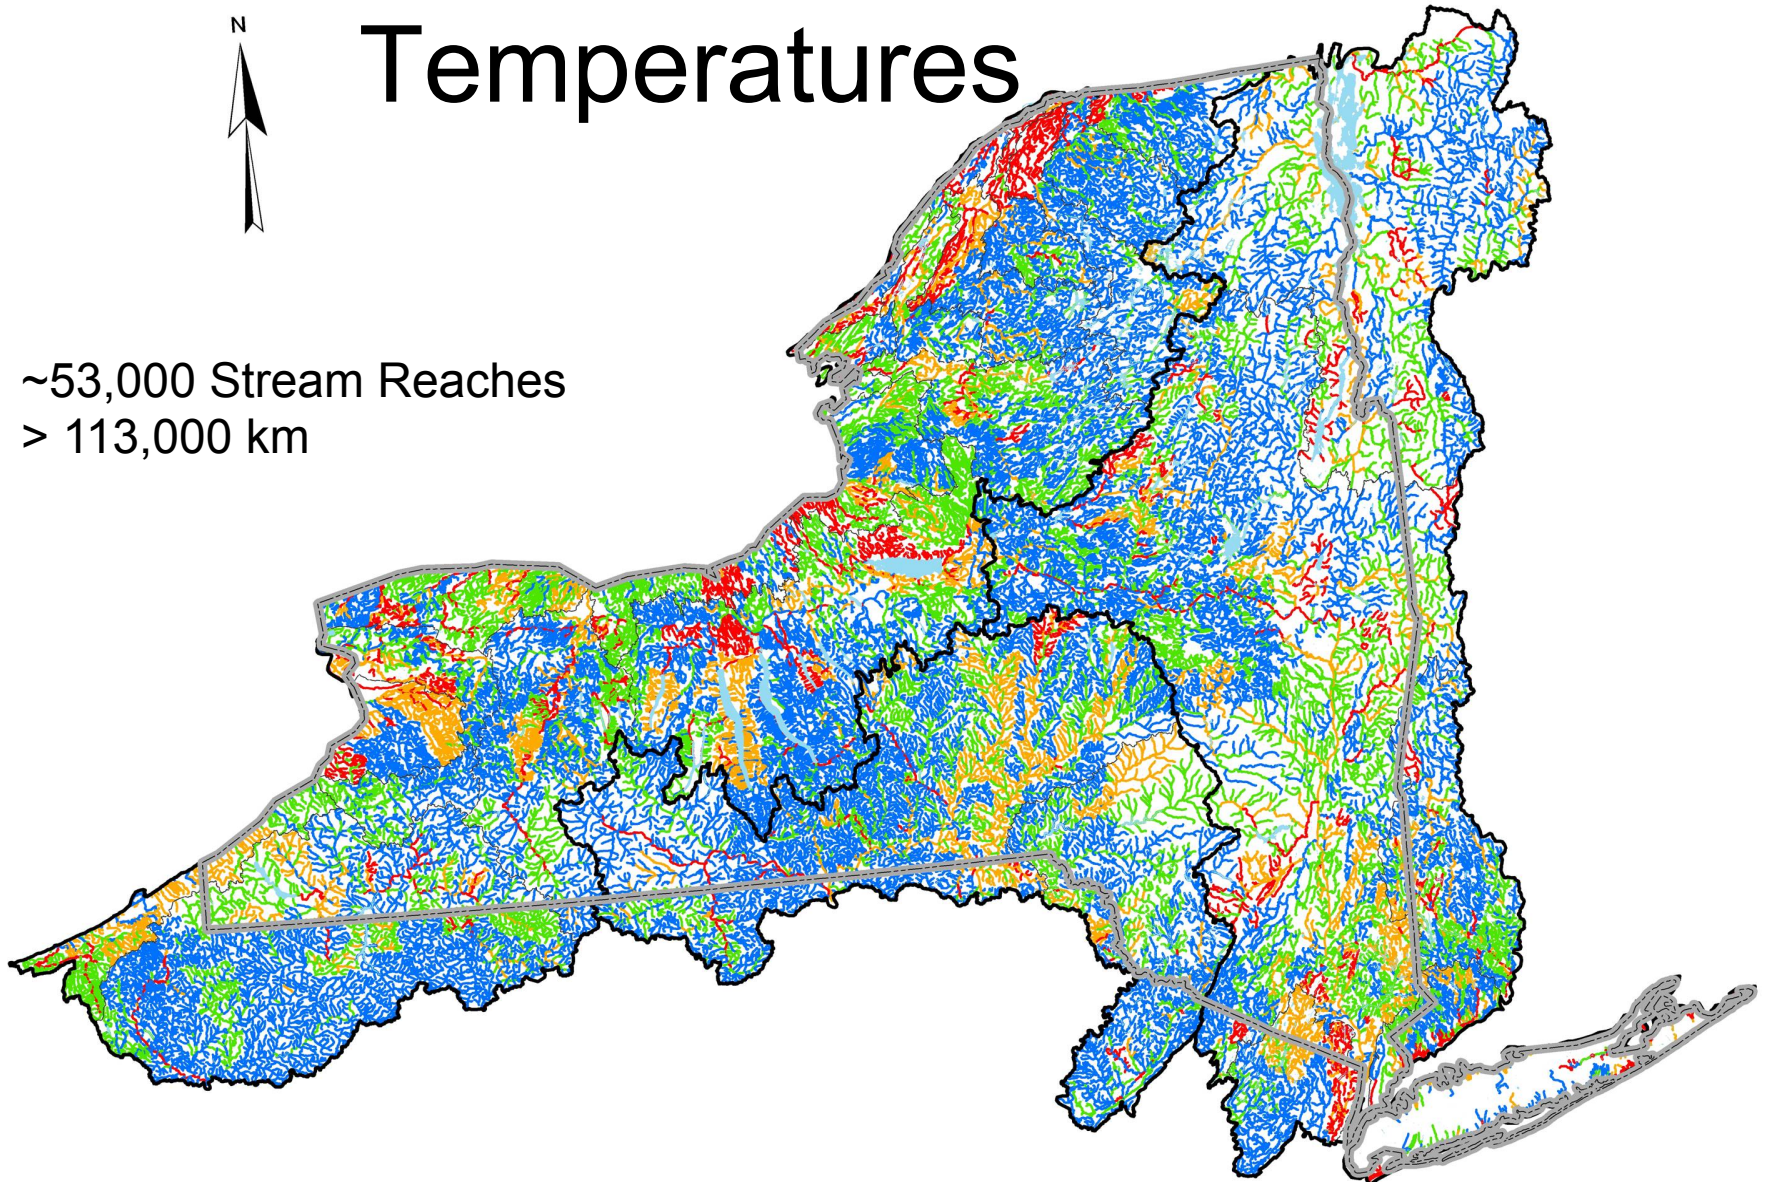

WARM

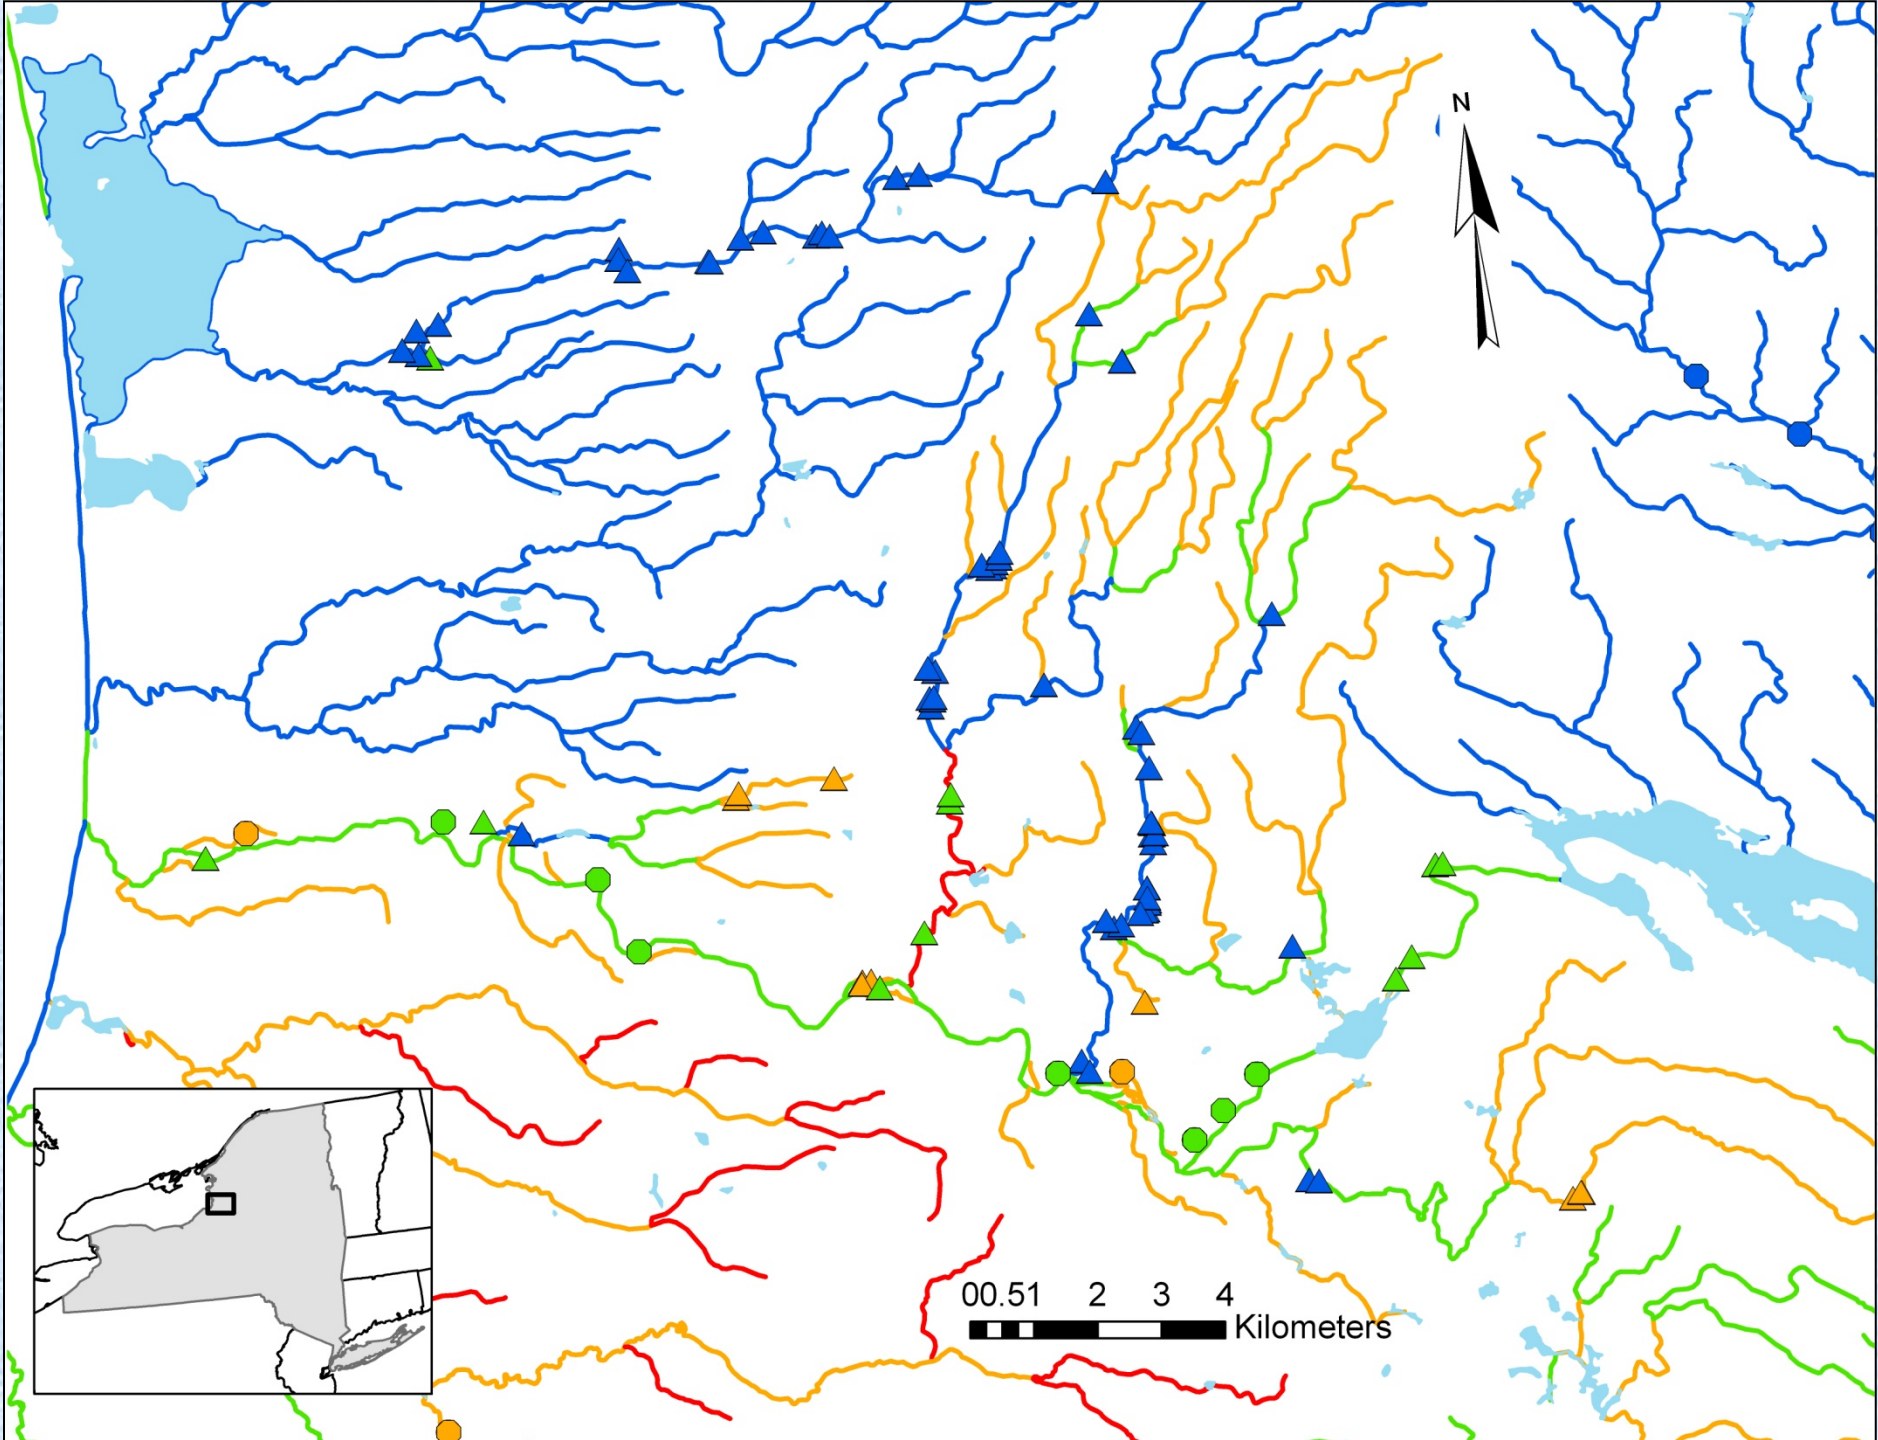

Model-predicted Stream Temperatures

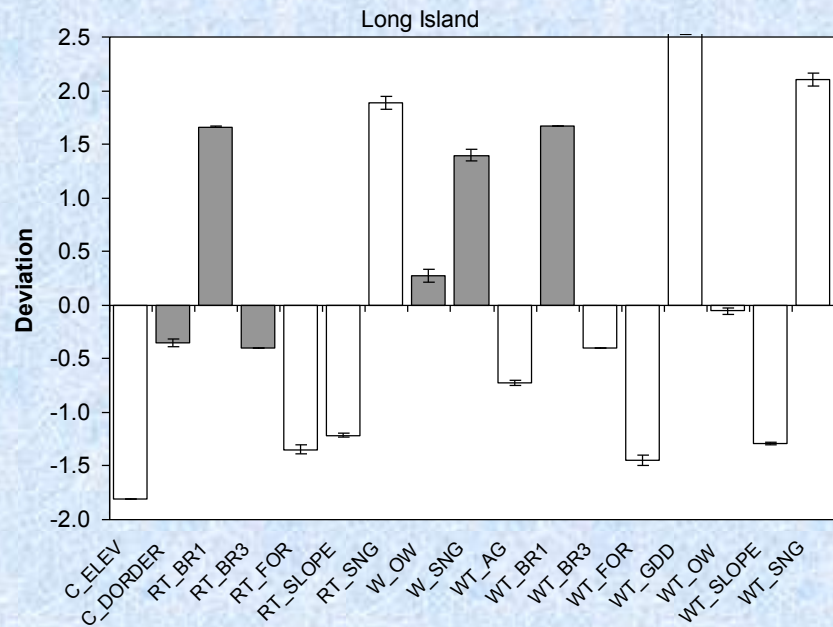

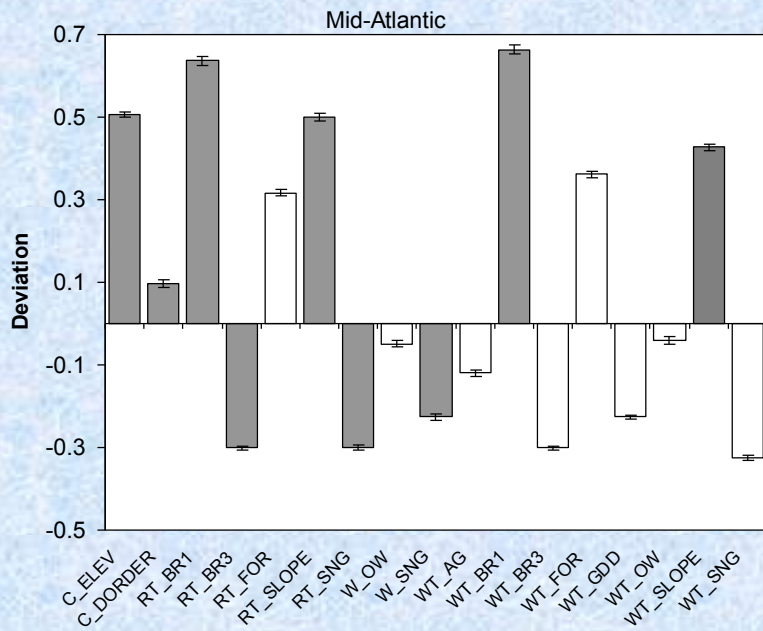

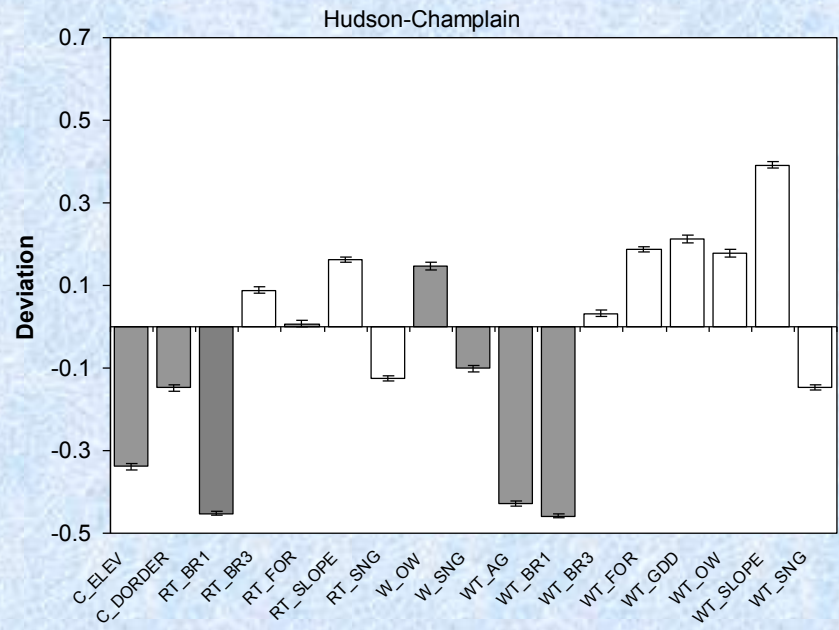

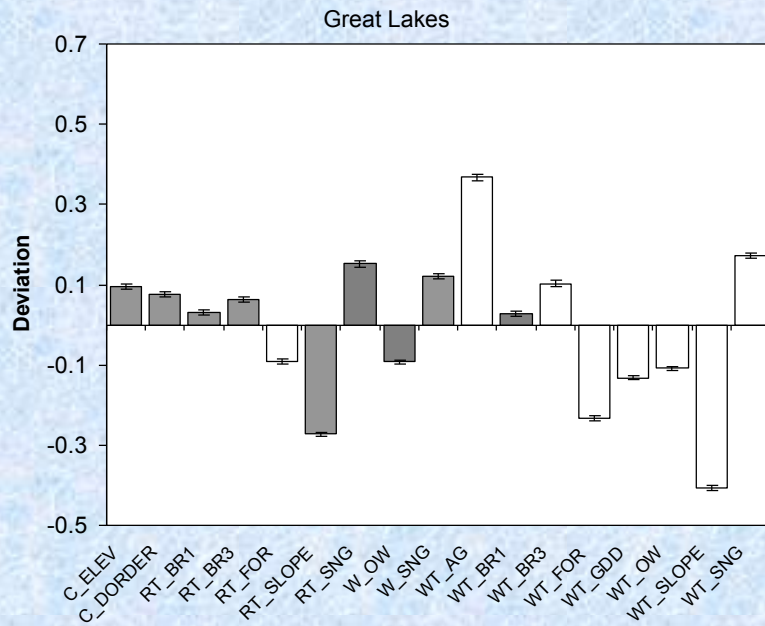

~53,000 Stream Reaches
> 113,000 km

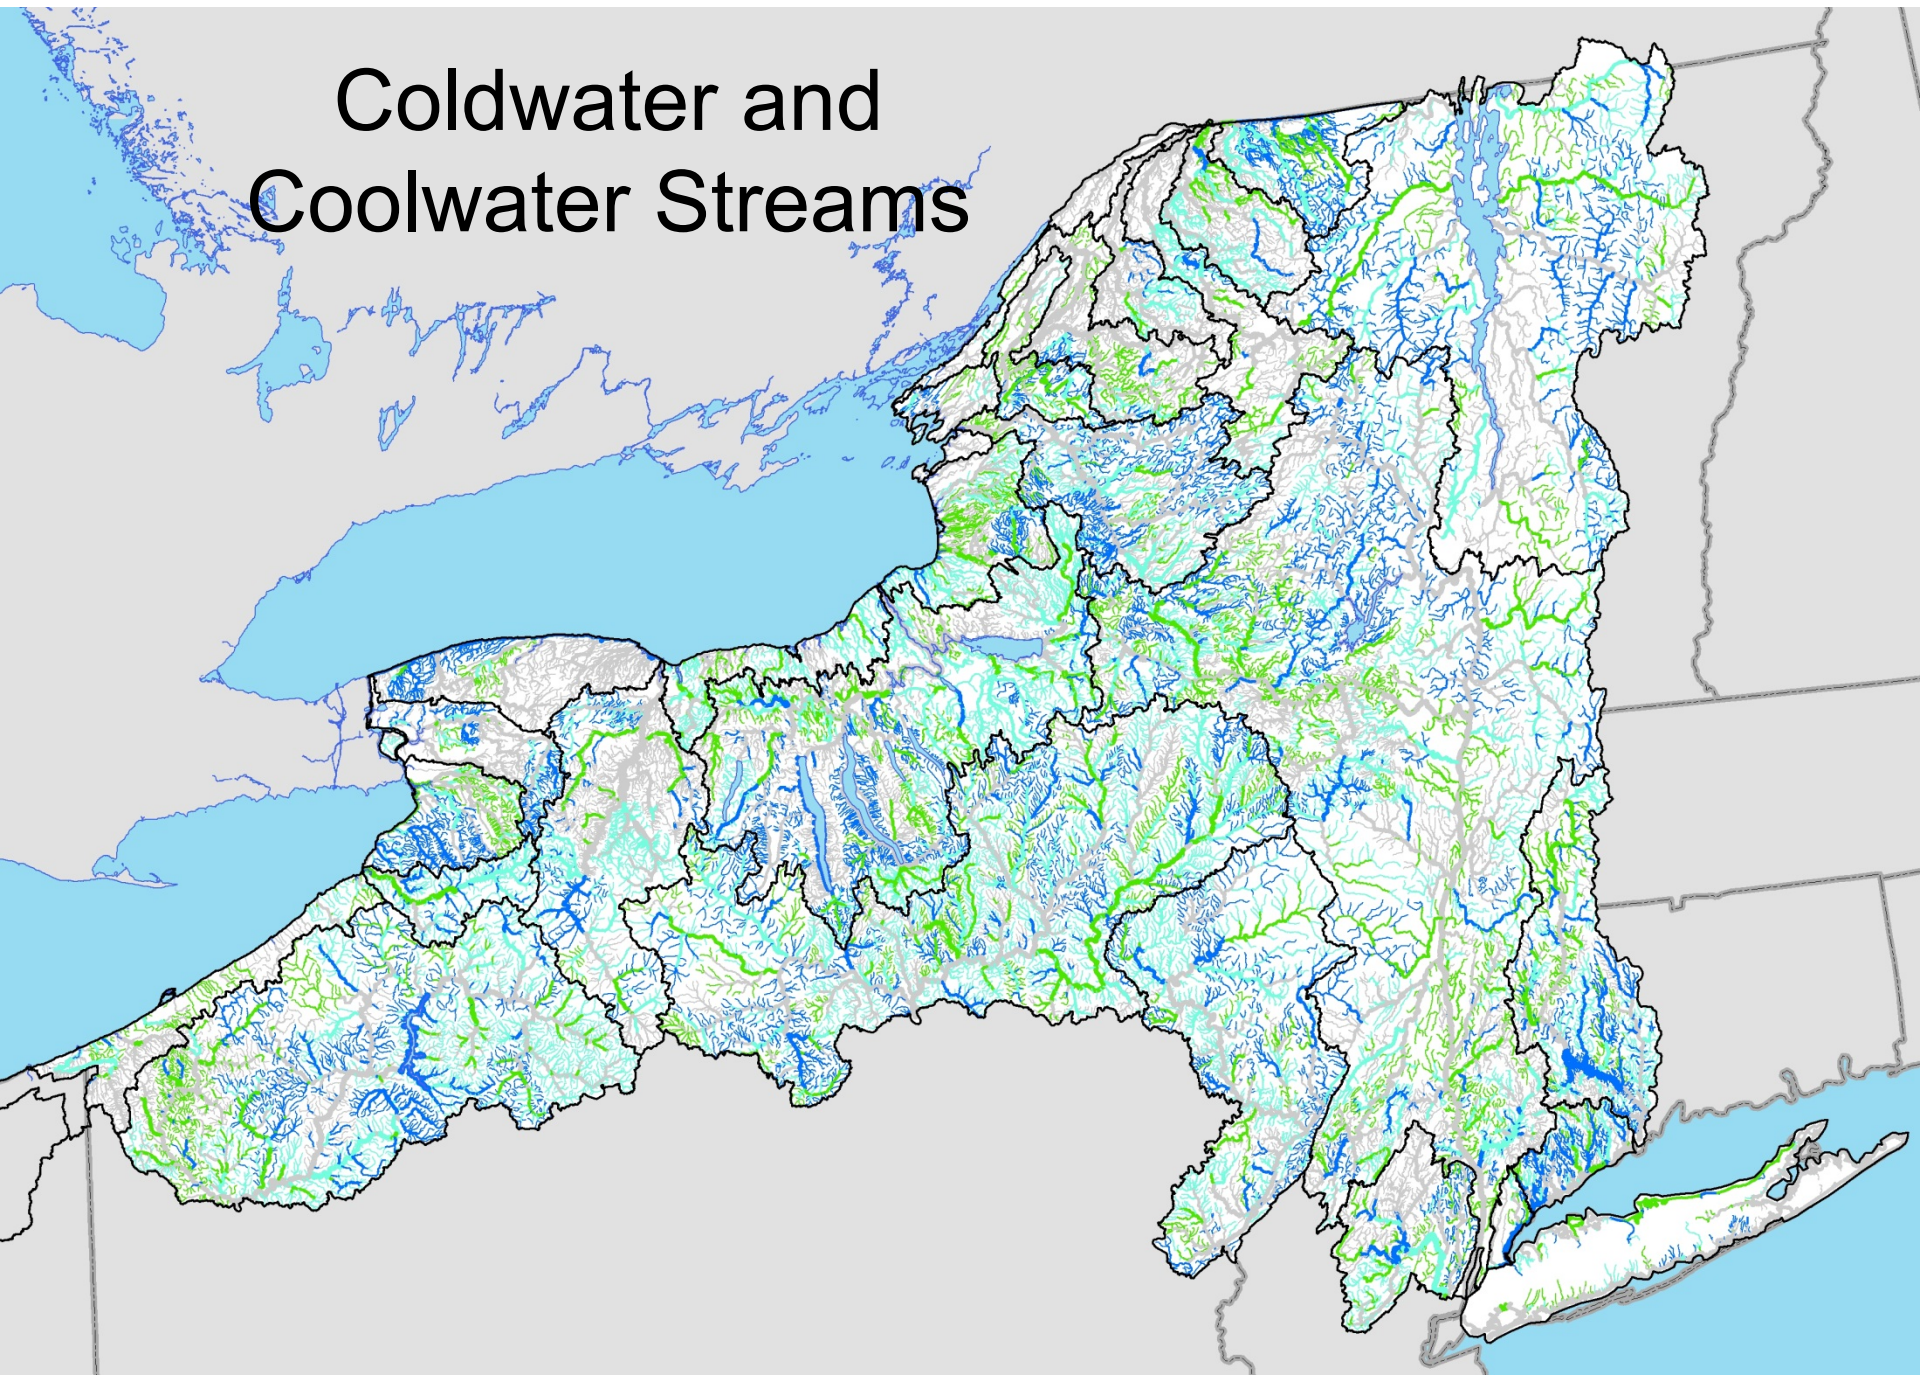

0 25 50 100 150 200
Kilometers
