Designing Sustainable Landscapes Project

The **purpose** of the Designing Sustainable Landscapes (DSL) project is to:

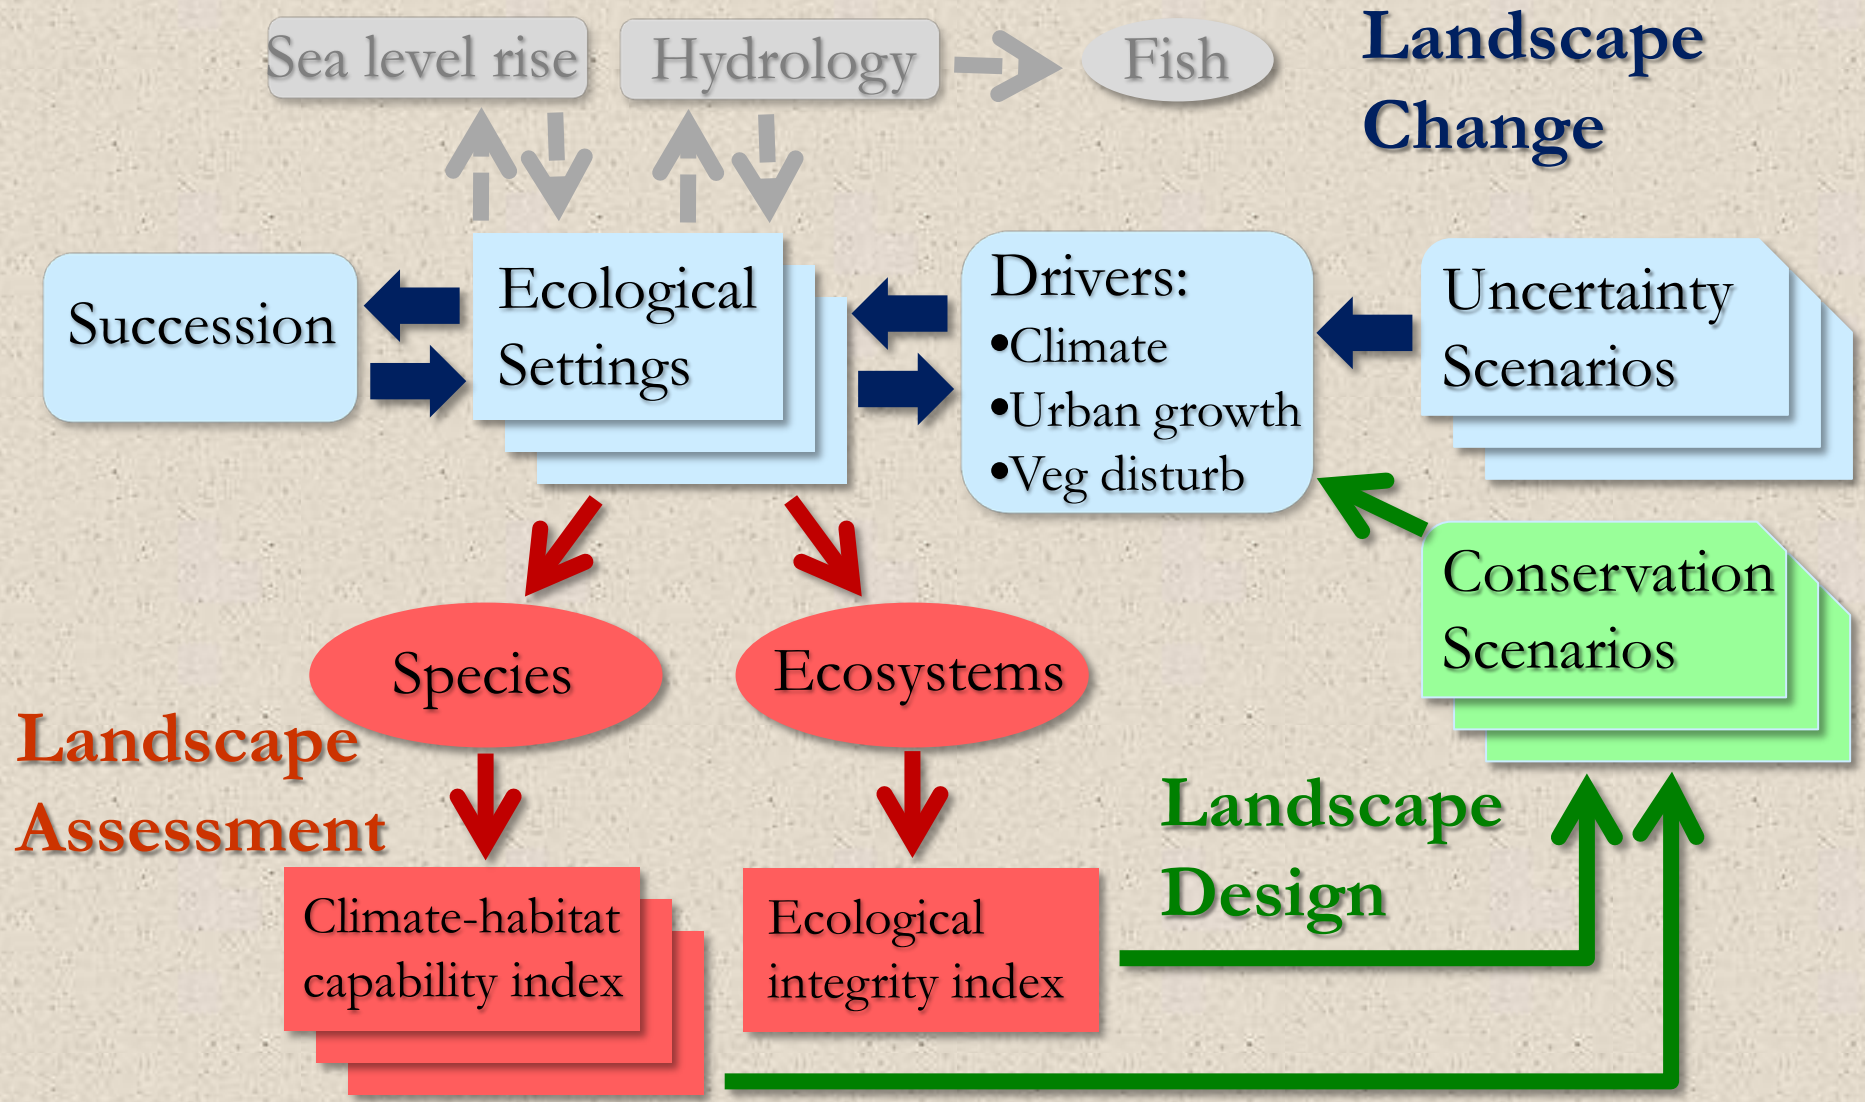

- **Assess the capability of current and potential future landscapes** to provide integral ecosystems and suitable habitat for a suite of representative species, and provide guidance for strategic habitat conservation

Landscape

- **Change**
- **Assessment**
- **Design**

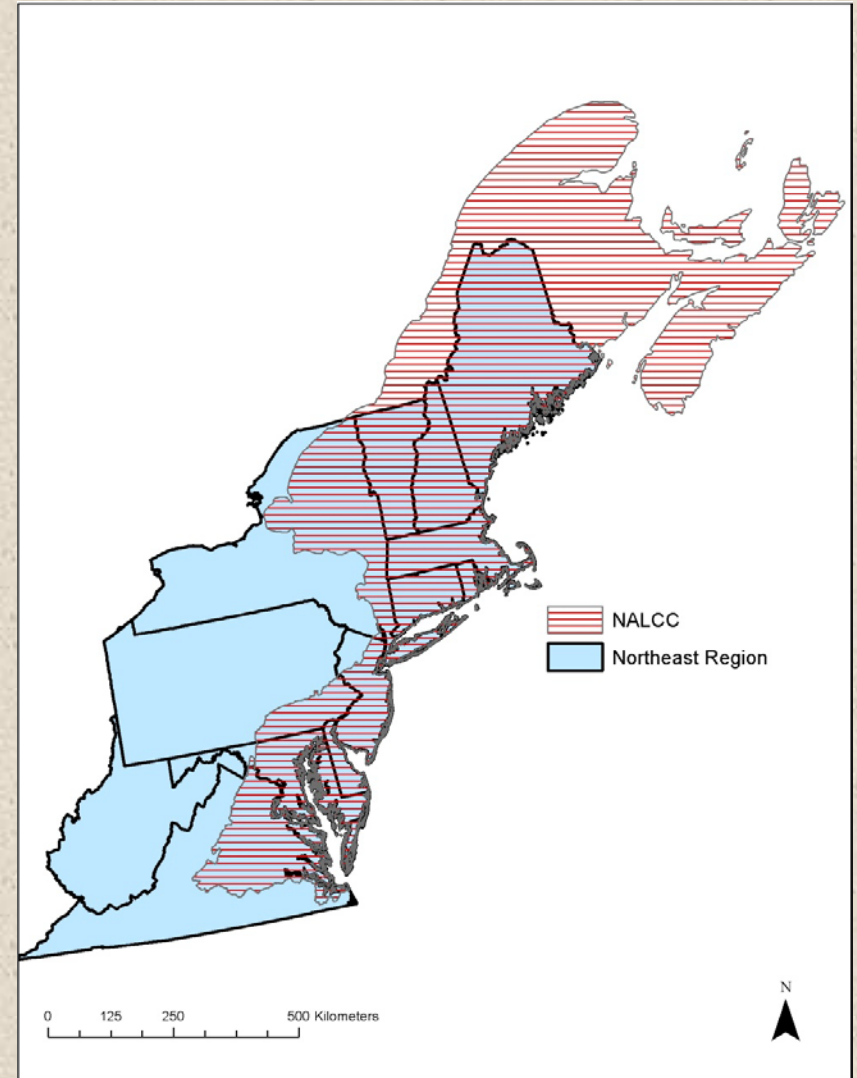

LCAD Model

LCAD Model

Designing Sustainable Landscapes Project

- Geographic scope of DSL
 - Northeast Region
 - Includes U.S. portion of the *North Atlantic LCC* (for the interim) and portions of the *Upper Midwest/Great Lakes LCC* and *Central Appalachian LCC*

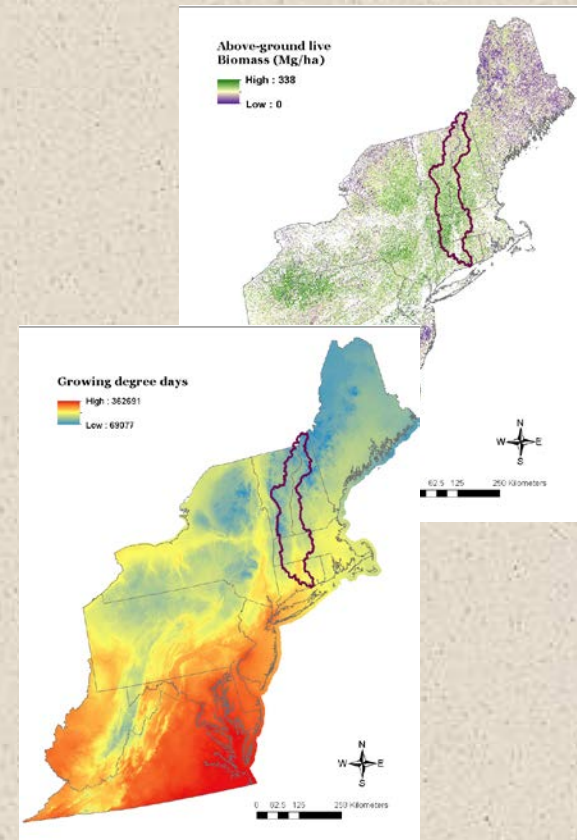

Landscape Change

Ecological Settings

“GIS layers including a broad but parsimonious suite of biophysical variables representing the natural and anthropogenic environment at each cell at each timestep”

- Measure magnitude of abiotic, vegetation or anthropogenic attributes
- Raw-scaled metrics (most are non-negative and unbounded)
- High value = more of it
- Used to measure ecological dissimilarity and resistance in ecological integrity metrics and in modeling species distributions

Landscape Change

Ecological Settings

Abiotic (15):

- **Temperature:**
 - Min winter temperature
 - Growing season degree days
 - Heat index ($>35^{\circ}$ C)
 - Stream temperature
- **Solar energy:**
 - Incident solar radiation
- **Moisture & hydrology:**
 - Topographic wetness
 - Flow volume
 - Flow gradient
- **Chemical & physical substrate:**
 - CaCO₃ content
 - Soil available water supply
 - Soil depth
 - Soil pH
 - Substrate mobility
- **Physical disturbance:**
 - Slope
 - Wind exposure

Landscape Change

Ecological Settings

Vegetation (2):

- Potential dominant life form
- Above-ground live biomass

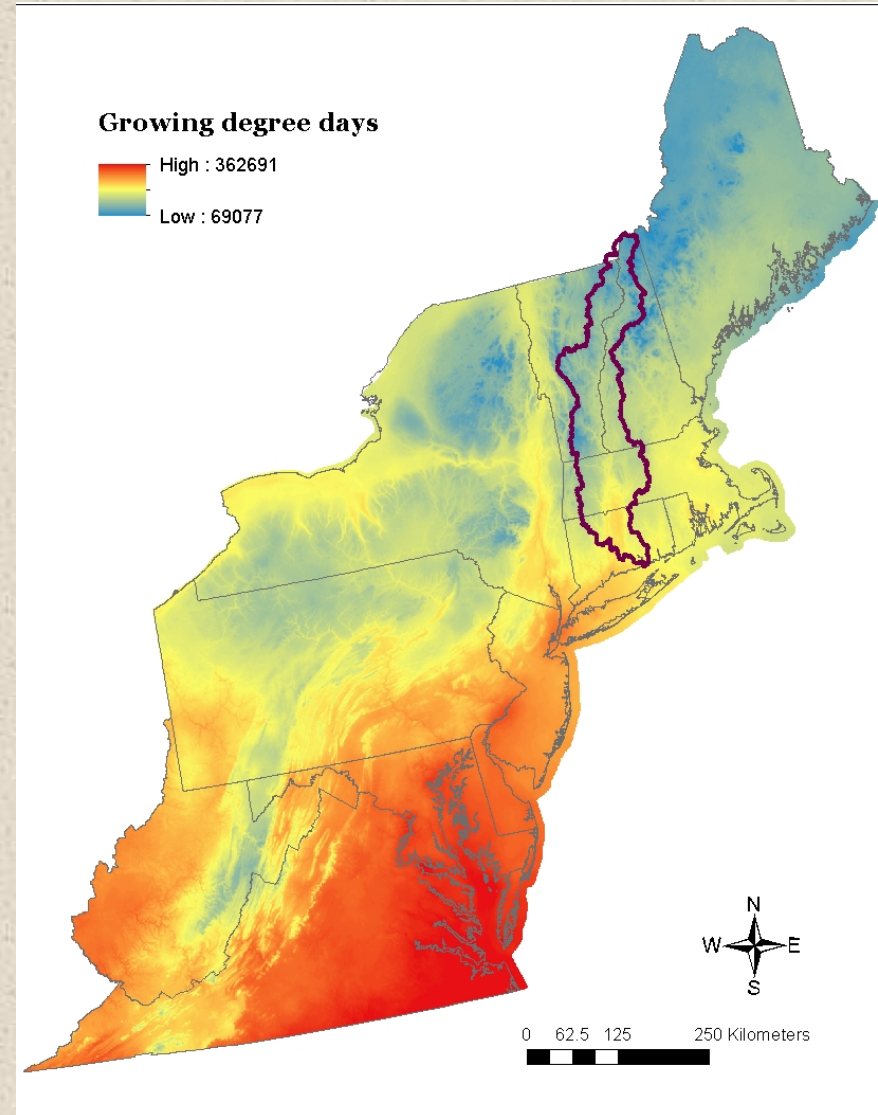

Anthropogenic (6):

- Gibbs traffic rate
- Developed
- Hard development
- Imperviousness
- Terrestrial barriers
- Aquatic barriers

Landscape Change

Ecological Settings

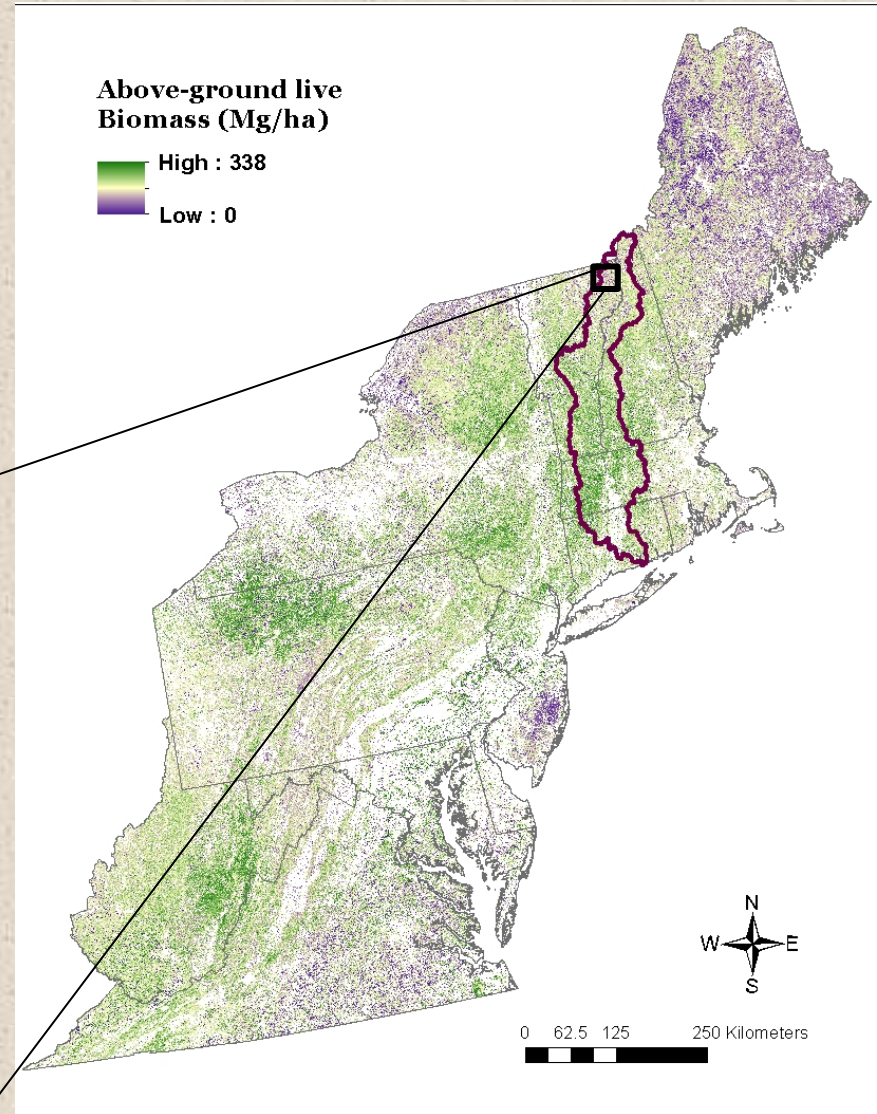

- **Growing degree days...**
the sum across days of the number of degrees by which the mean daily temperature exceeds a threshold of 10^0 C

Landscape Change

Ecological Settings

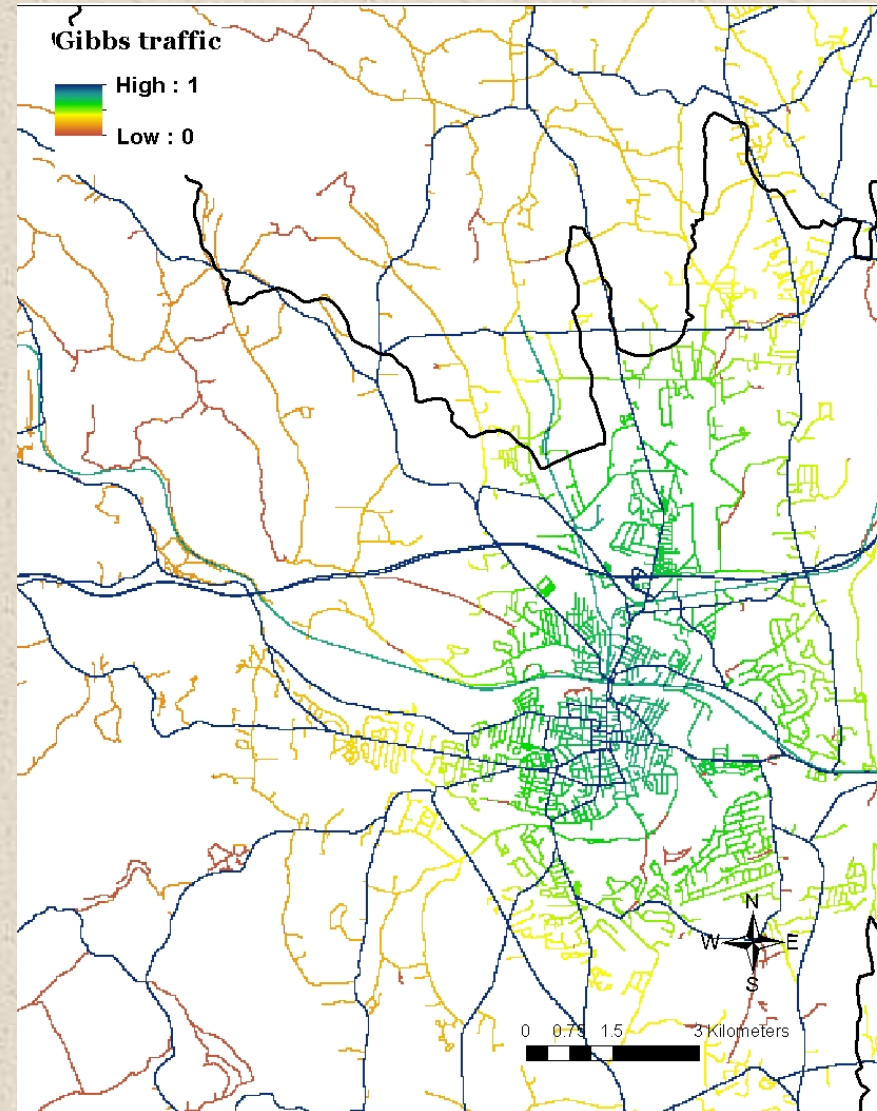

- Above-ground live biomass... modified from Woods Hole NACP Above-ground National Biomass and Carbon Baseline Data V.2

Landscape Change

Ecological Settings

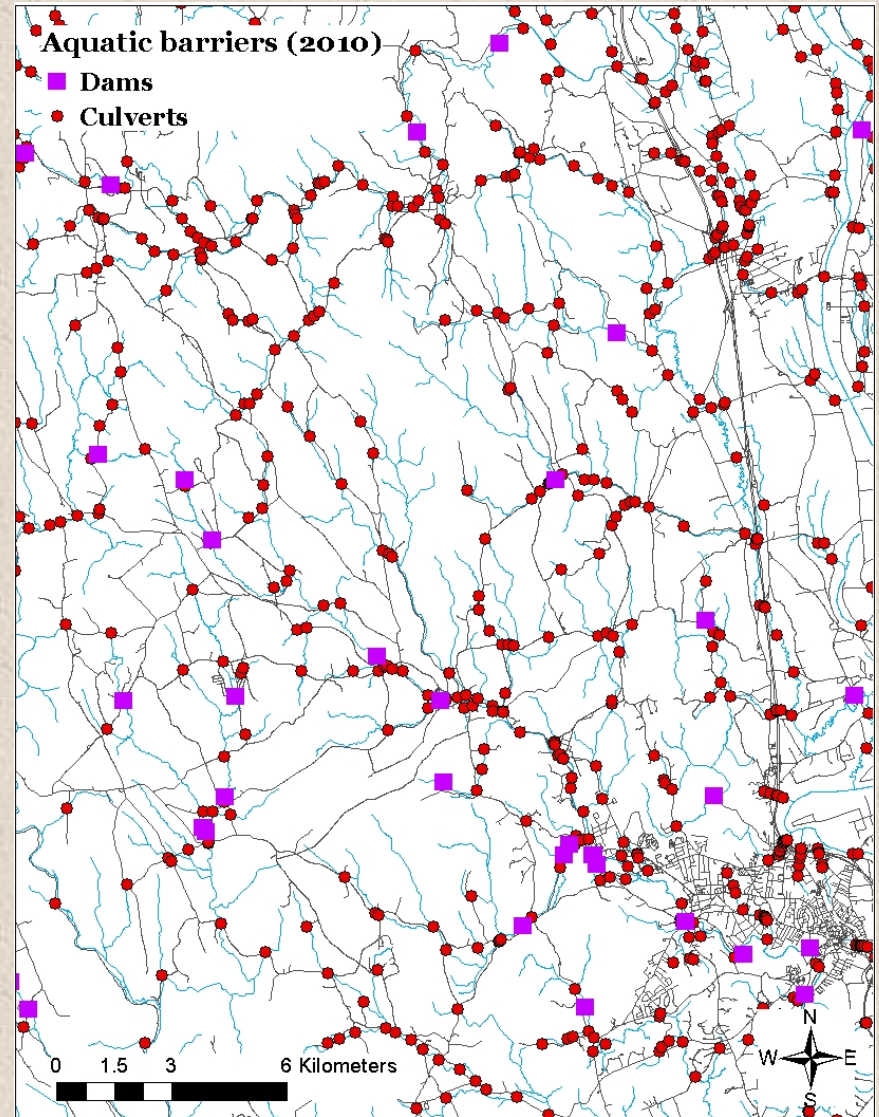

- **Gibbs traffic rate...**
imputed average number of vehicles per day on roads and railways transformed into probability of road-crossing mortality based on the Gibbs model (Gibbs and Shriver 2002).

Landscape Change

Ecological Settings

- **Aquatic barriers...** the degree to which culverts and dams may physically impede upstream and downstream movement of aquatic organisms; passability scores derived from custom algorithm based on field observations (where we have them) or modeled and applied to dams and road-stream crossings.

Landscape Change

Ecological Settings

- **NHD based streams...**
hydrologically corrected the high resolution (1:24k) NHD streams for use in representing the stream network and deriving the flow related ecological settings variables for streams.

Landscape Change

Ecological Settings

“Ecological systems represent recurring groups of biological communities that are found in similar physical environments and are influenced by similar dynamic ecological processes, such as fire or flooding”

(Natureserve)

17 formations

27 macrogroups

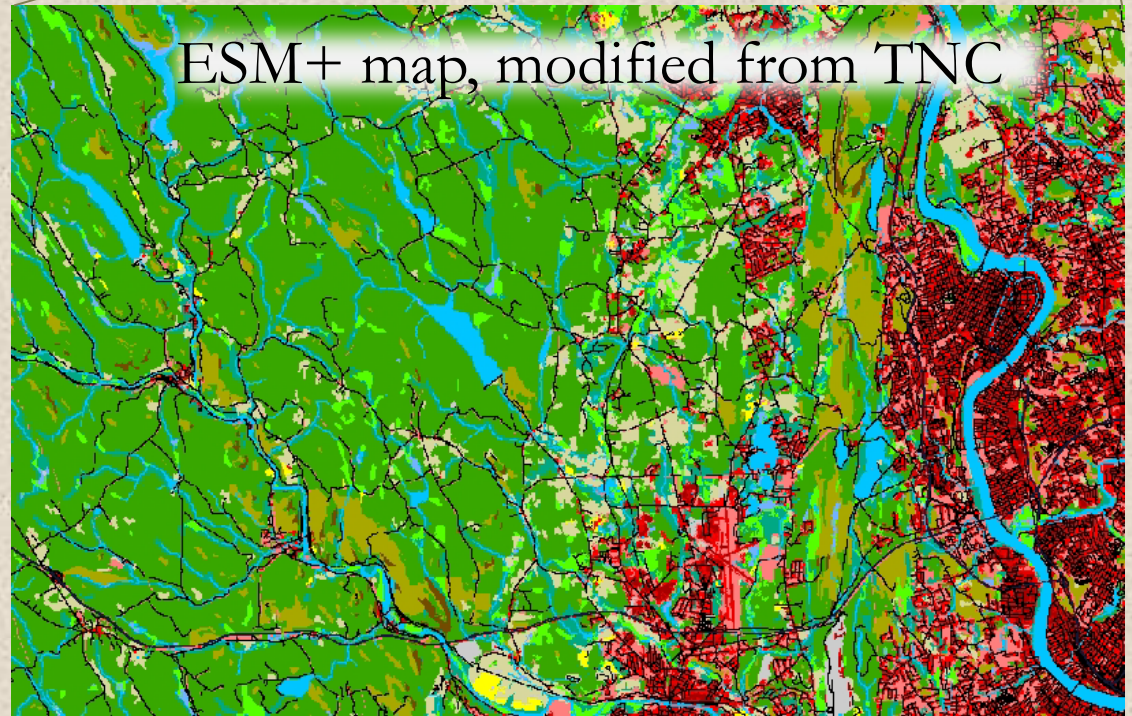

196 systems

Appalachian

hemlock-northern

hardwood forest:

typic

Landscape Change

Ecological Settings

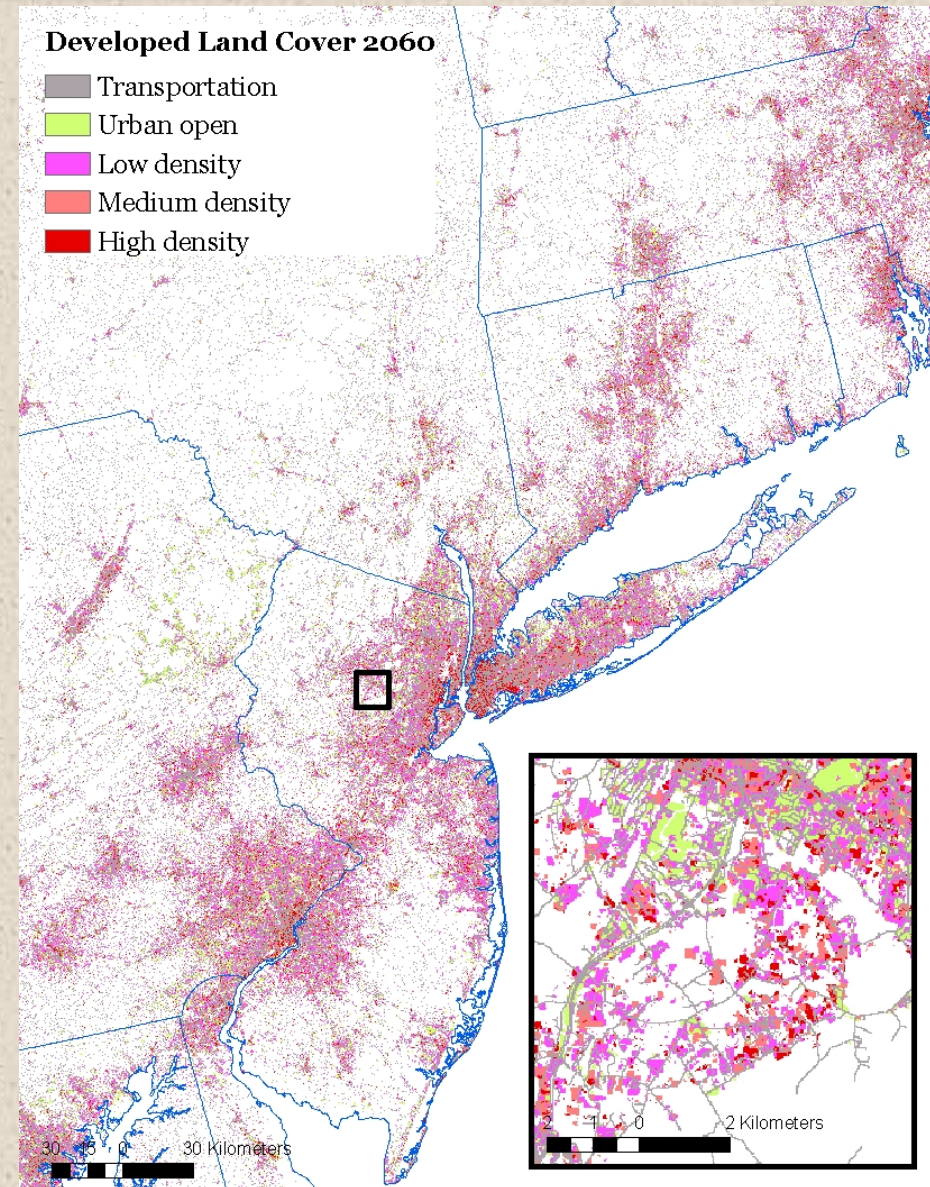

Major modifications to TNC's ESM:

- Replaced misaligned NLCD roads (confounded with development) with more accurate roads/trains;
- Removed spurious development (mostly developed open space) from the edges of NLCD roads;
- Added NHD high resolution streams, road-stream crossings and dams;
- Replaced the single open water class in ESM with various lentic and lotic classes;
- Replaced the ESM estuarine classes with updated NWI estuarine and marine classes;
- Replaced the single developed and agriculture classes in ESM with five developed and two agriculture classes from NLCD 2006.

Landscape Change

Urban Growth

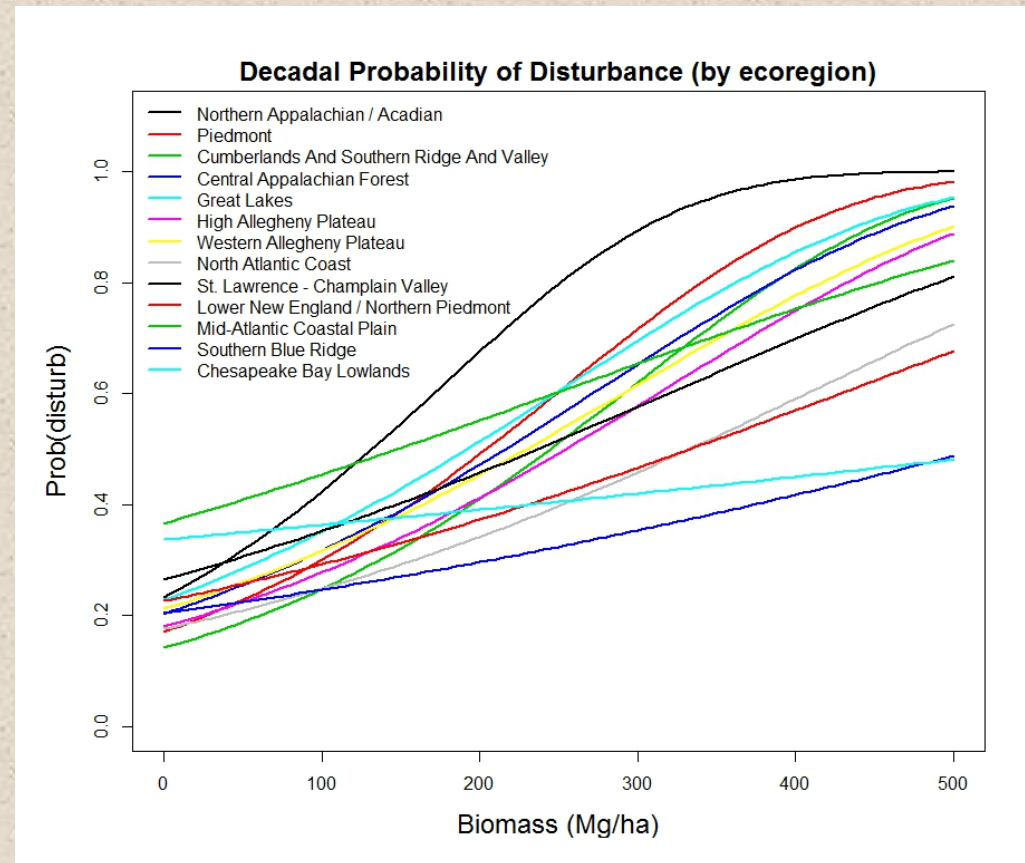

- Multi-stage statistical model to stochastically allocate amount and pattern of development at each timestep
- Updated to model growth across the region with scenarios to vary total amount and sprawliness of growth relative to historical patterns

Landscape Change

Vegetation Disturbance

- Generic statistical disturbance model
- Updated to reflect variation in disturbance rate and intensity as a function of ecoregion and existing biomass based on FIA data

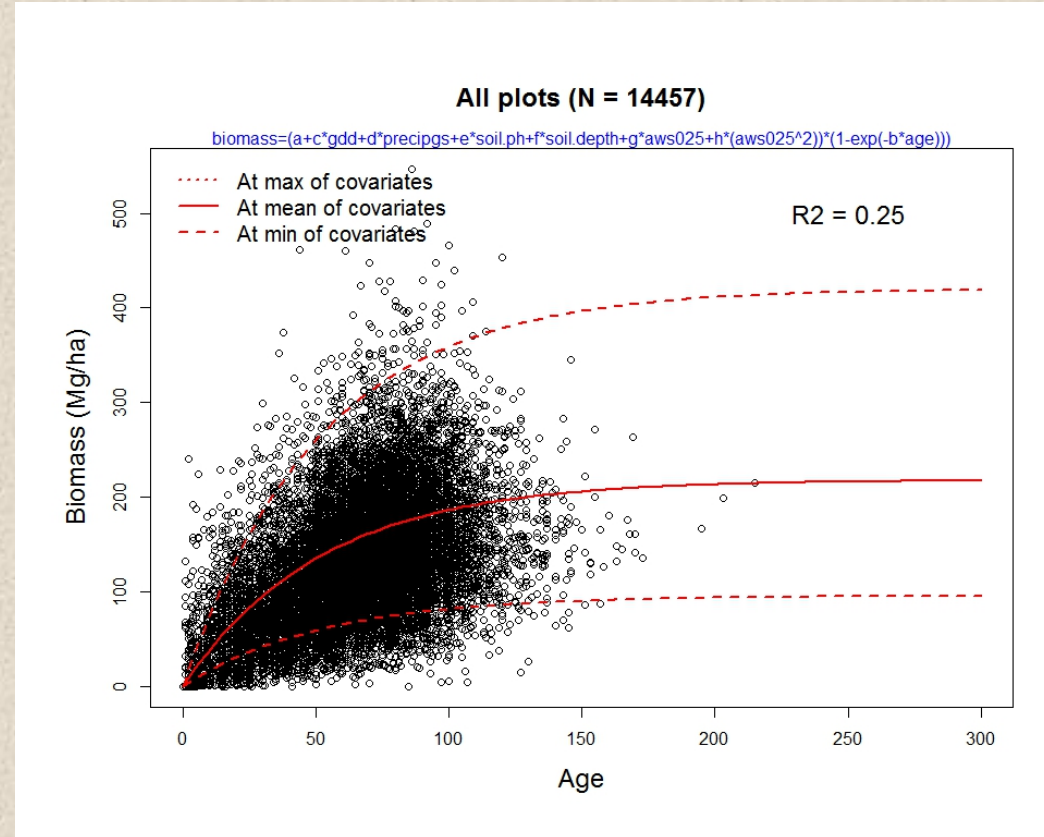

Note, disturbance types are confounded

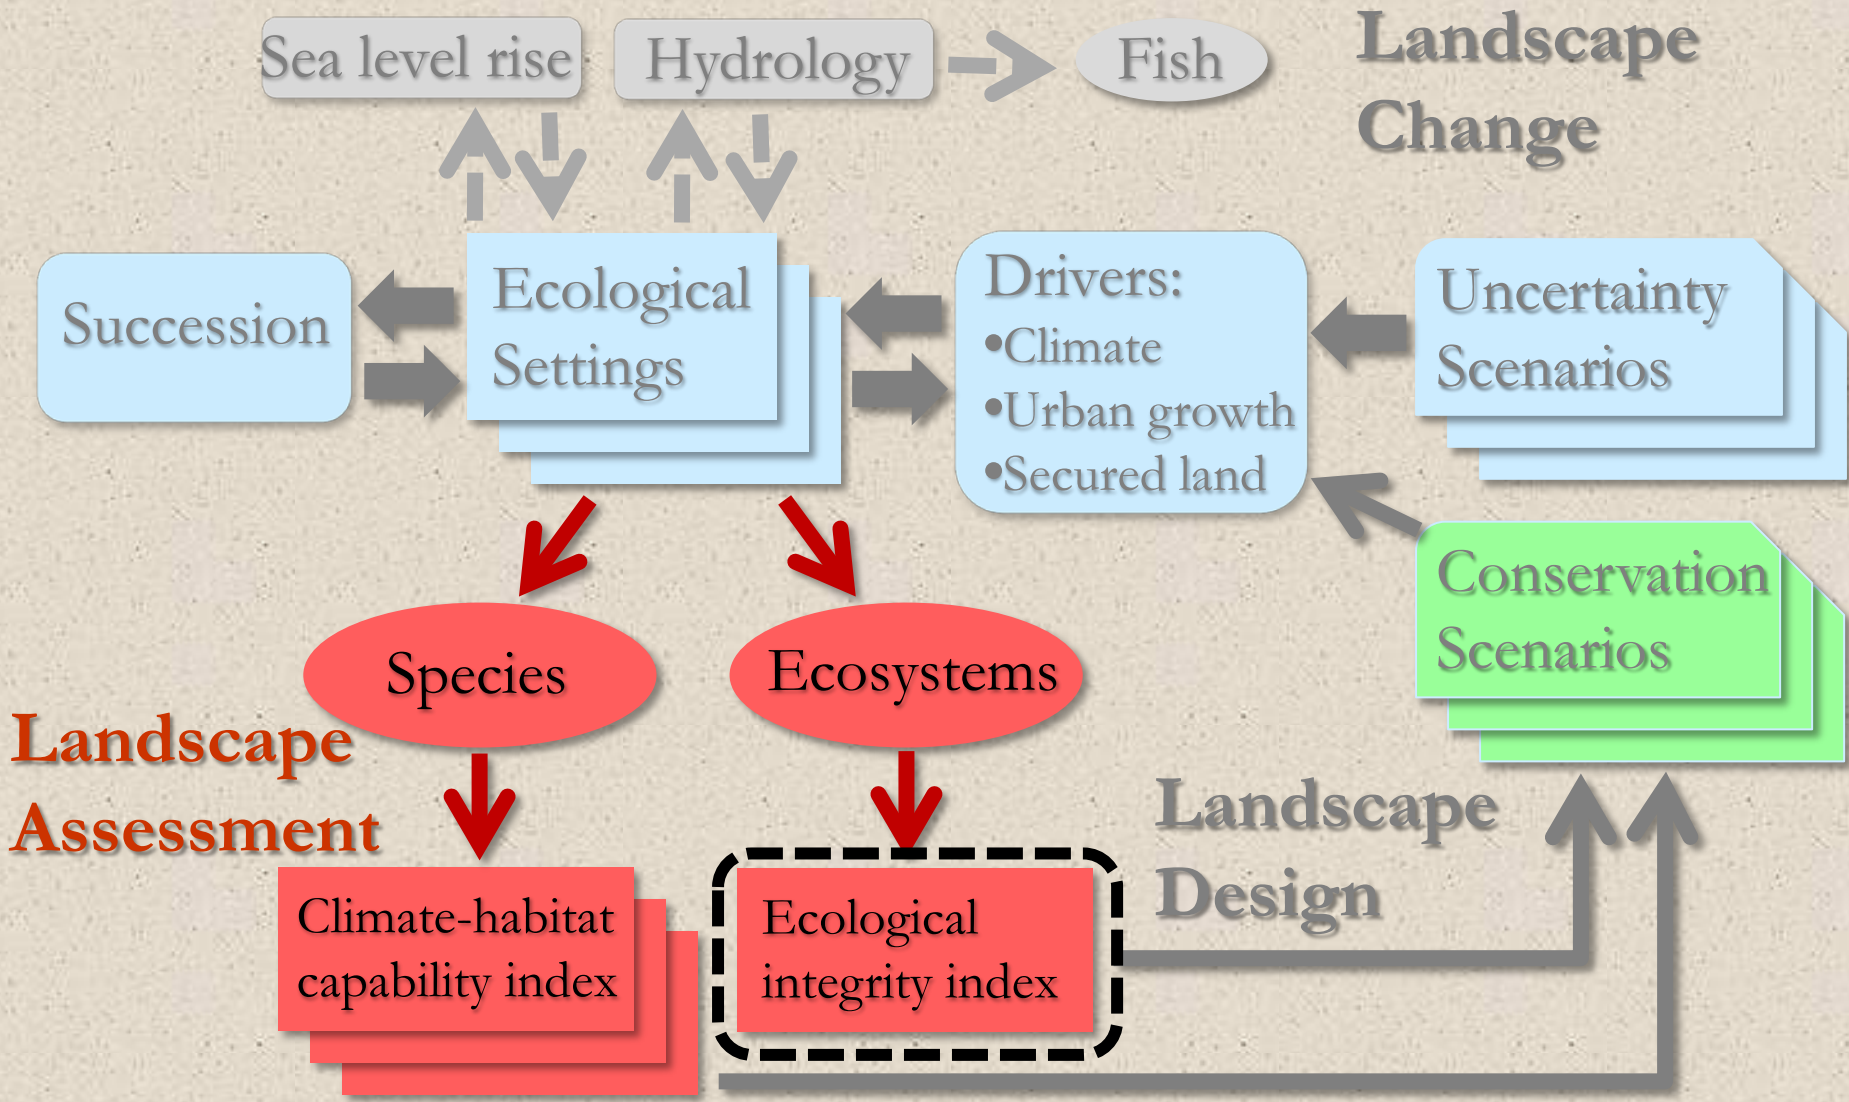

Landscape Change

Succession

- Generic statistical succession model
- Updated to reflect variation in succession trajectory as a function of spatial covariates (gdd, precipgs, soil.ph, soil.depth, aws025) and stand age based on FIA data

LCAD Model

Landscape Assessment

Local integrity metrics

*future only

■ Development and roads:

- Habitat loss
- Watershed habitat loss
- Road traffic
- Mowing and plowing
- Microclimate alterations

■ Pollution:

- Watershed road salt
- Watershed sediment
- Watershed nutrient enrichment

■ Climate change:

- Climate alteration*

■ Biotic alterations:

- Domestic predators
- Edge predators
- Non-native invasive plants
- Non-native earthworms

■ Hydrologic alterations:

- Watershed imperviousness
- Dam intensity
- Sea level rise inundation*

■ Resiliency:

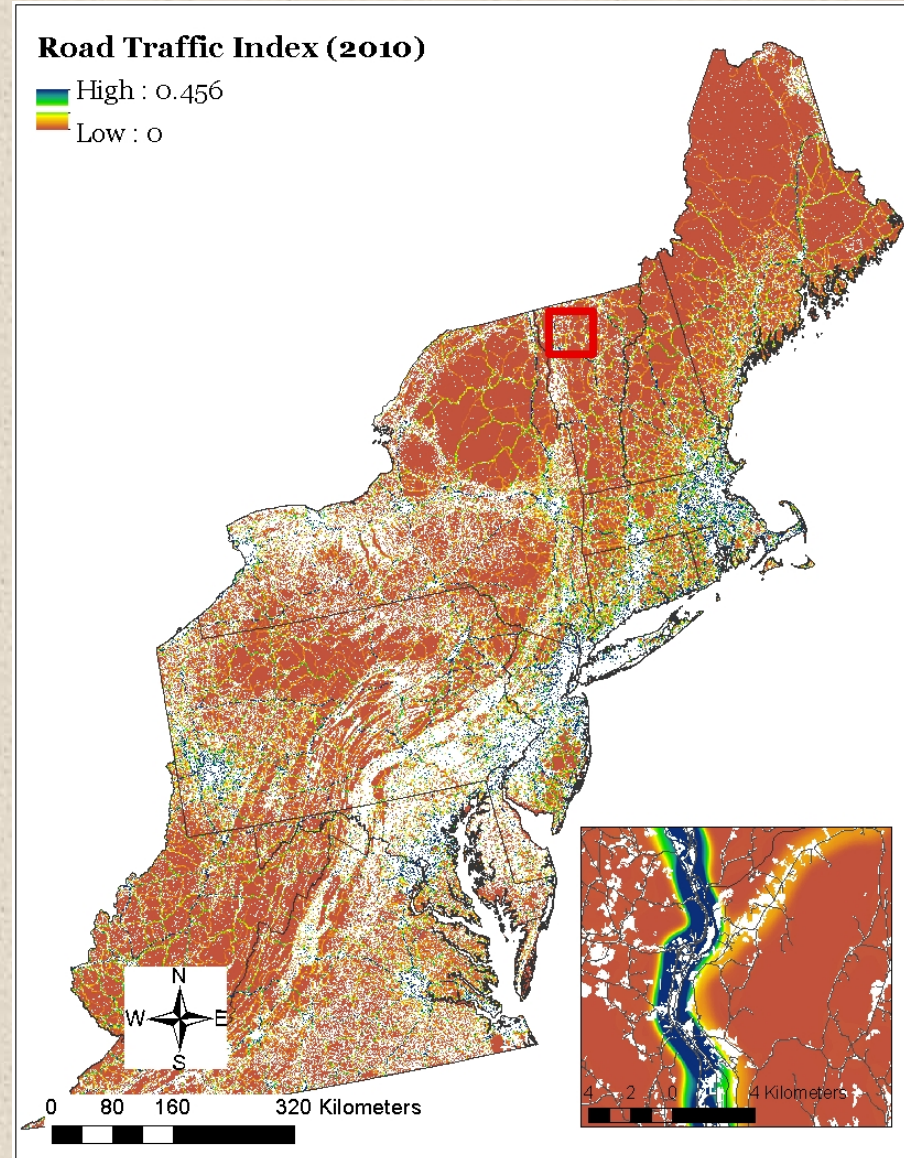

- Similarity
- Connectedness
- Aquatic connectedness

Landscape Assessment

Local integrity metrics

▪ Road traffic index

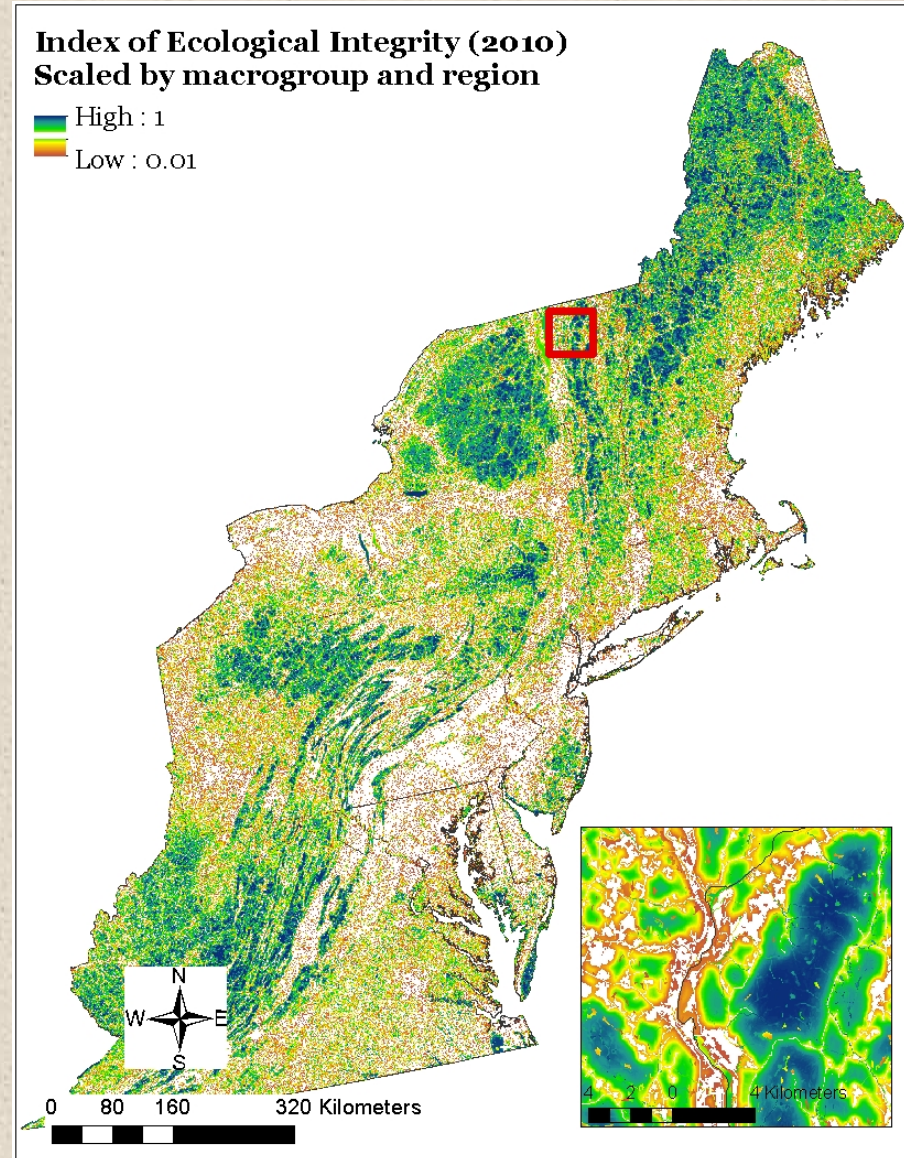

- Traffic intensity (Gibbs model transformed) within the ecological neighborhood of a cell
- Raw-scaled (0-1)
- High value = high traffic intensity (stressor level)

Landscape Assessment

Local integrity metrics

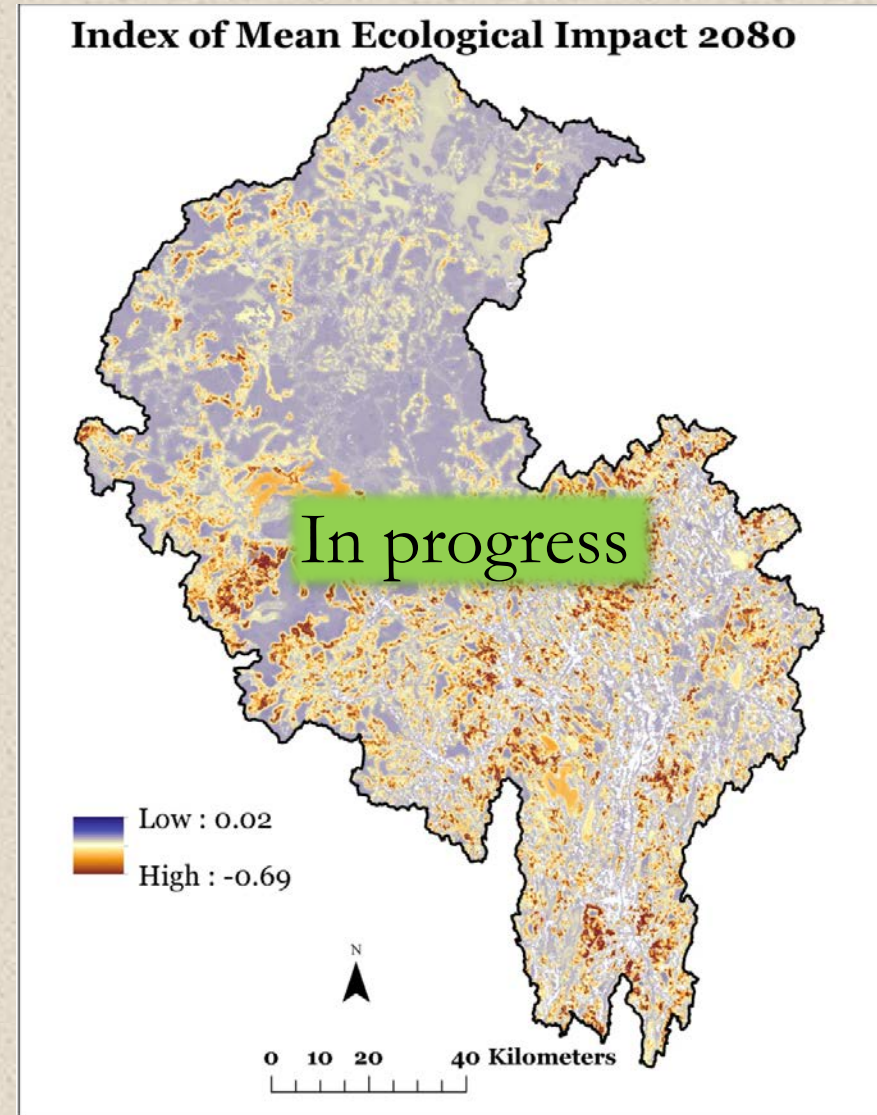

- Index of ecological integrity (IEI)
 - Weighted (by ecosystem) linear combination of individual metrics
 - Quantile-scaled (0-1) by ecosystem & extent (benchmarked to 2010)
 - High value = high integrity
 - Top x% interpretation

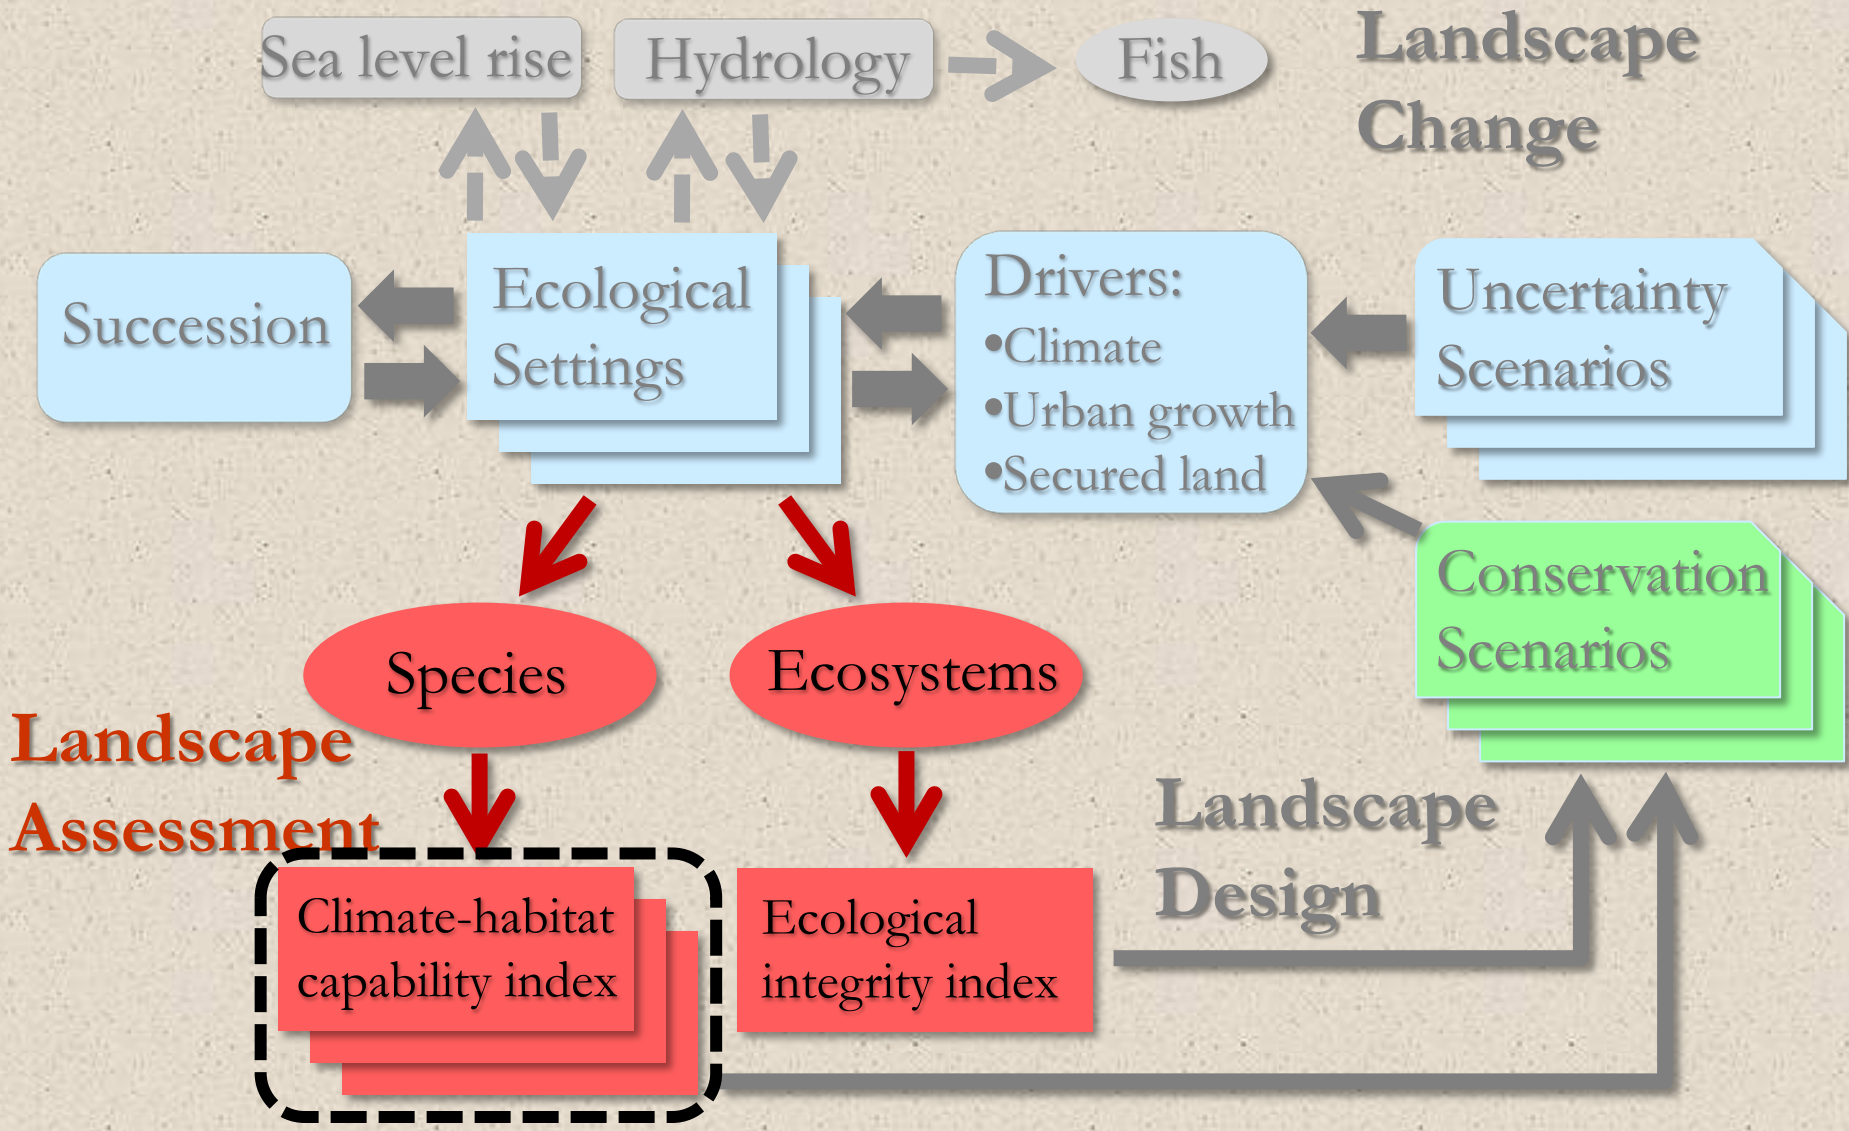

Landscape Assessment

Local integrity metrics

- Index of ecological impact
 - Weighted (by ecological system) linear combination of delta-scaled intactness and resiliency metrics multiplied by IEI in 2010
 - Mean Impact across uncertainty simulations
 - Computed for 2030 & 2080
 - Suitable for scenario comparison

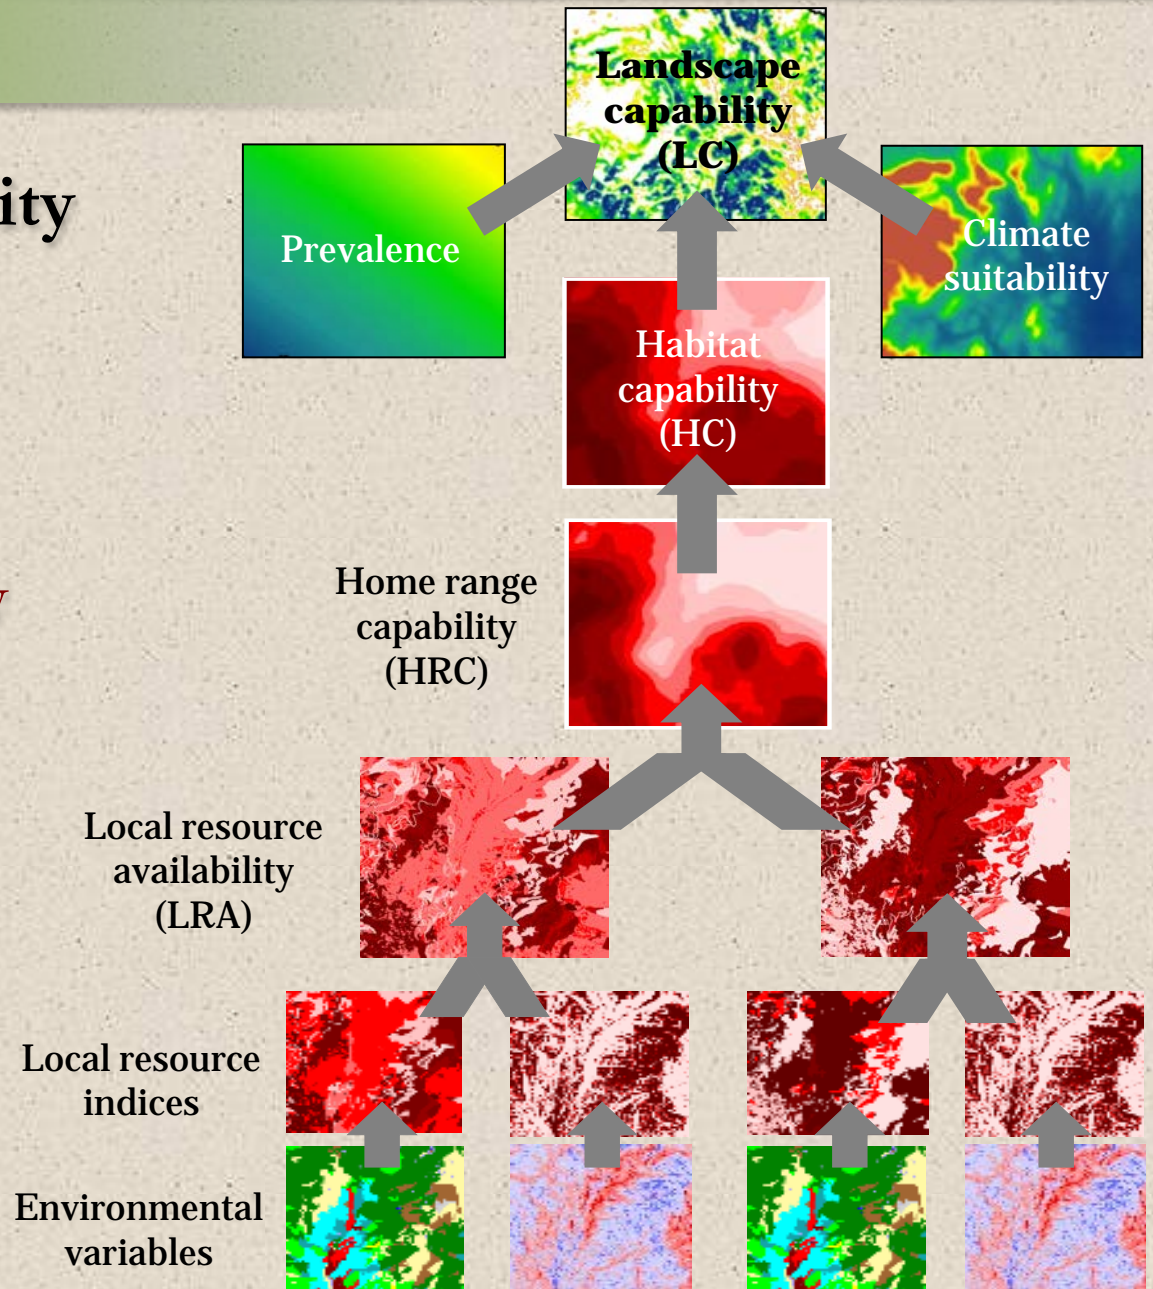

LCAD Model

Landscape Assessment

Species

- **Landscape capability index**
 - Spatially-explicit
 - Multi-scale
 - Expert/empirically-derived
 - Synthesis of habitat capability, climate suitability, and prevalence
 - Statistically validated

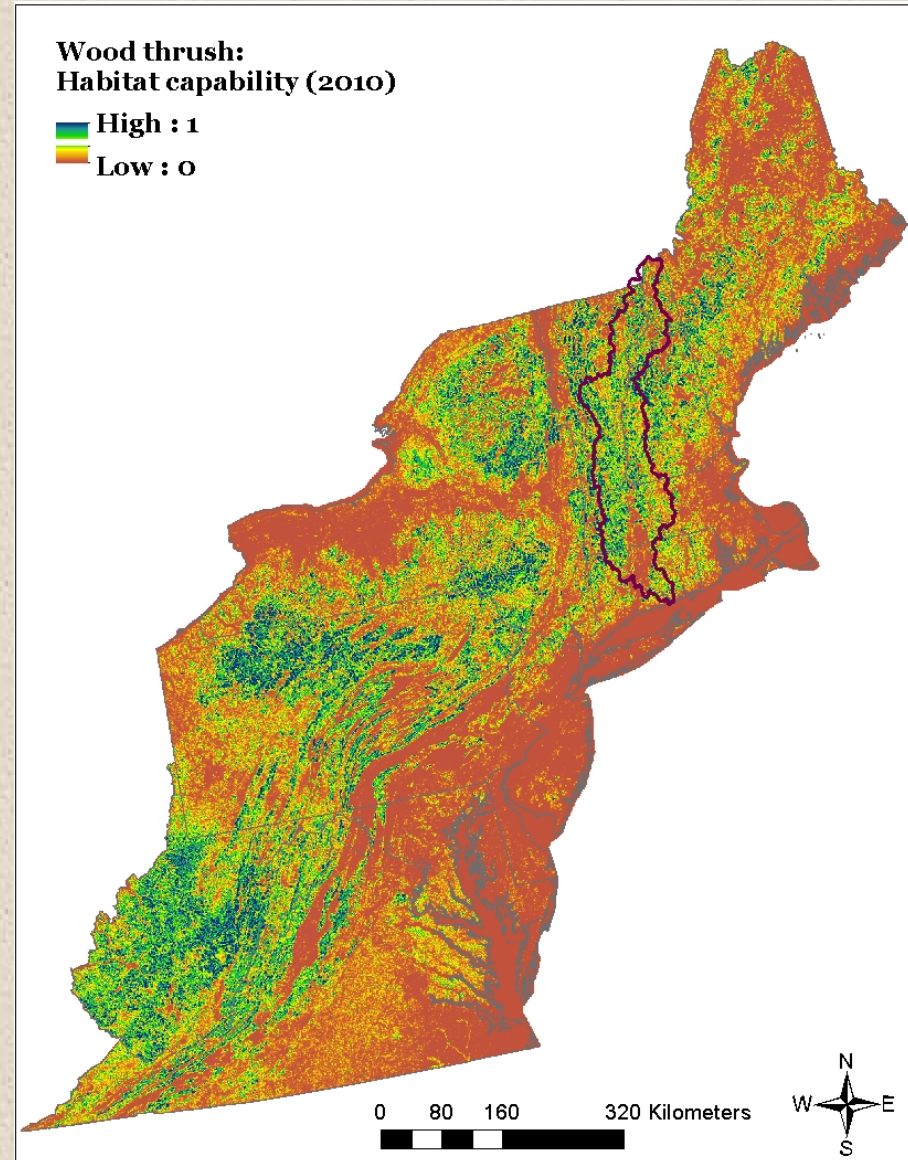

Landscape Assessment

Species

- Habitat capability index

Where is the *capable habitat* in 2010, 2030 or 2080 without regard to climate suitability and species' prevalence?

Wood thrush

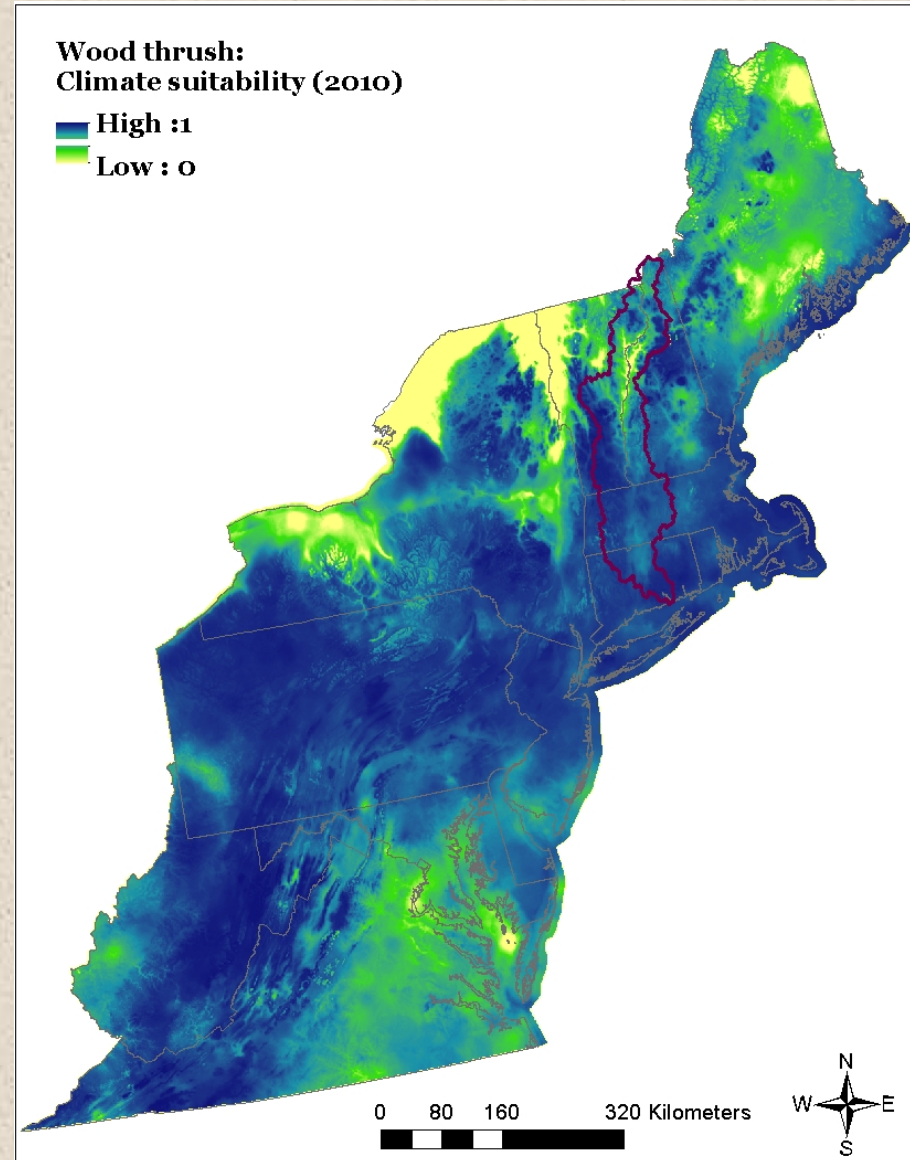

Landscape Assessment

Species

- Climate suitability index

Where is the *suitable* climate in 2010, 2030 or 2080 without regard to habitat and species' prevalence?

Wood thrush

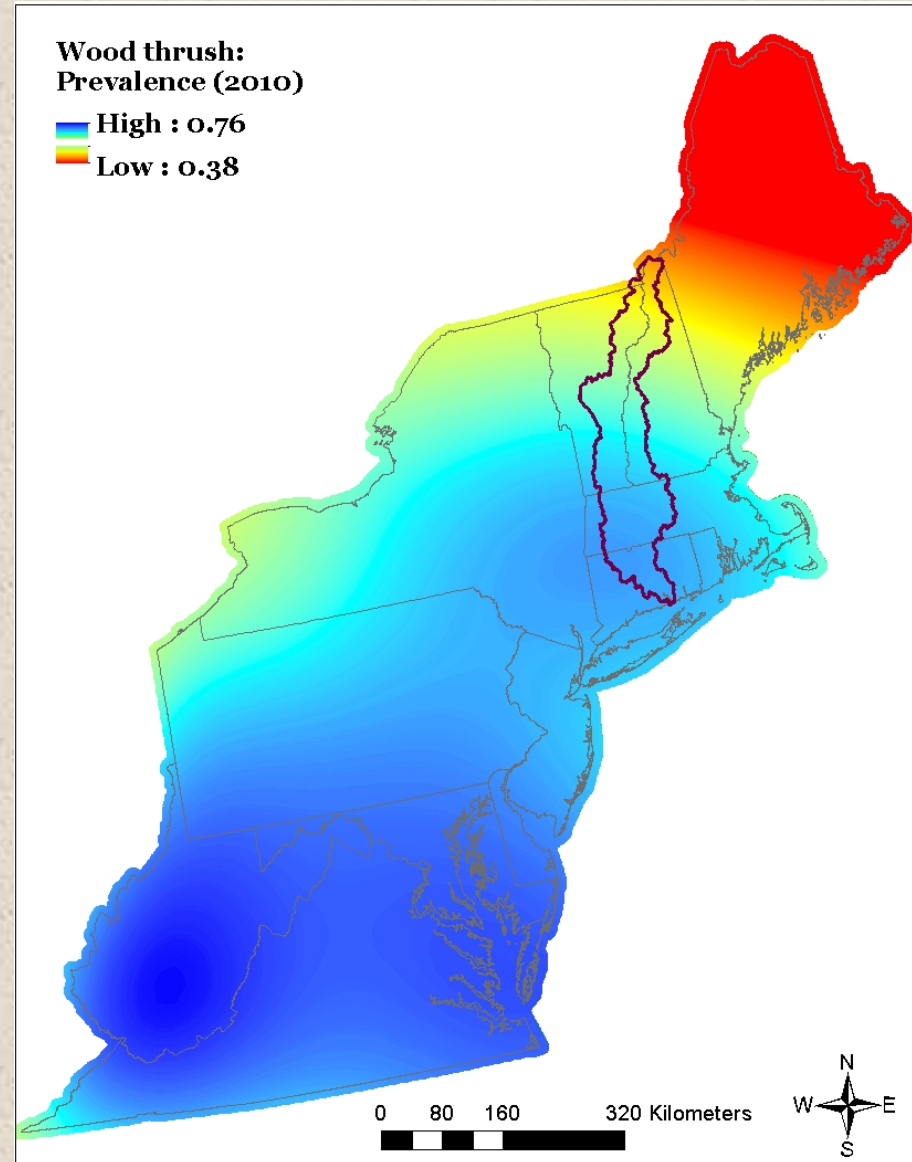

Landscape Assessment

Species

■ Prevalence index

Where is the species most *prevalent* in 2010, without explicit regard to habitat and climate suitability

Wood thrush

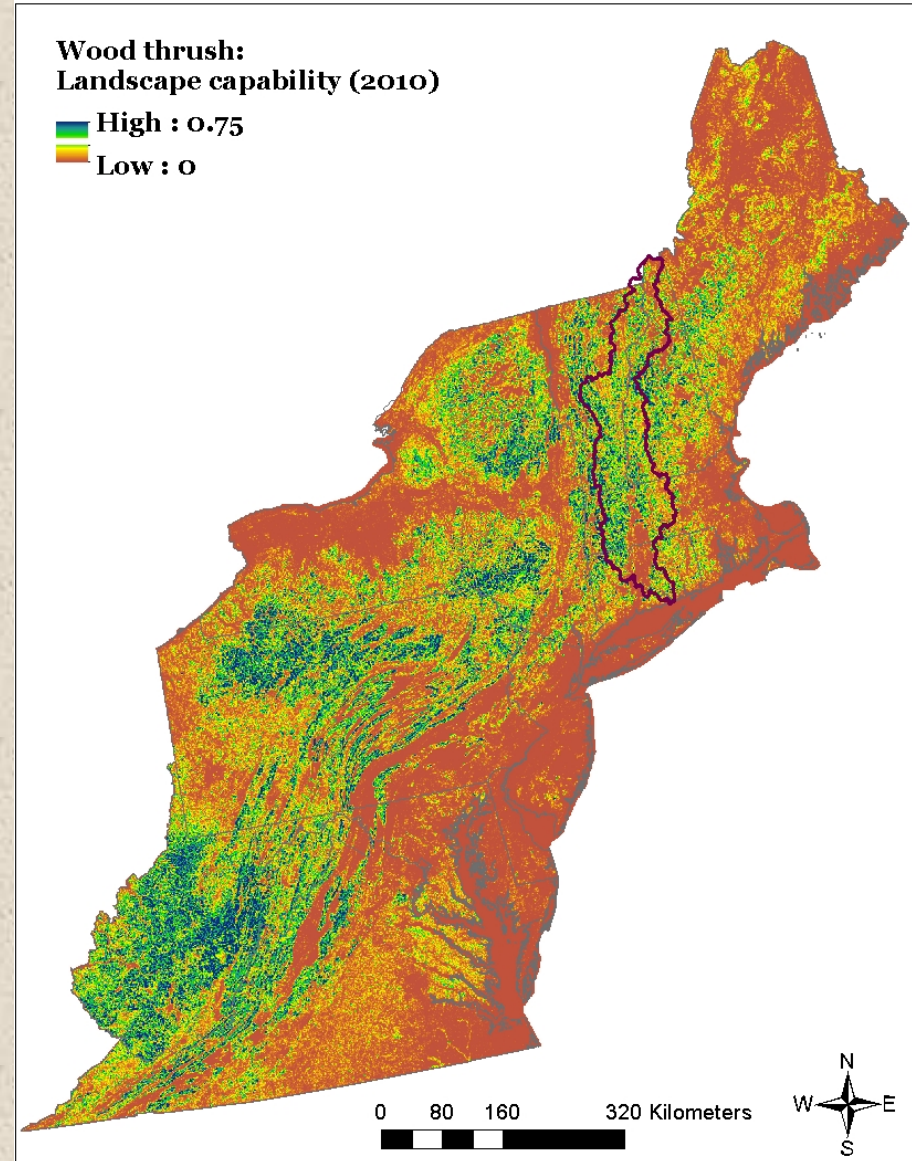

Landscape Assessment

Species

- Landscape capability index

Where is the species' most likely to *occur* in 2010, 2030 or 2080 based on habitat capability, climate suitability and prevalence?

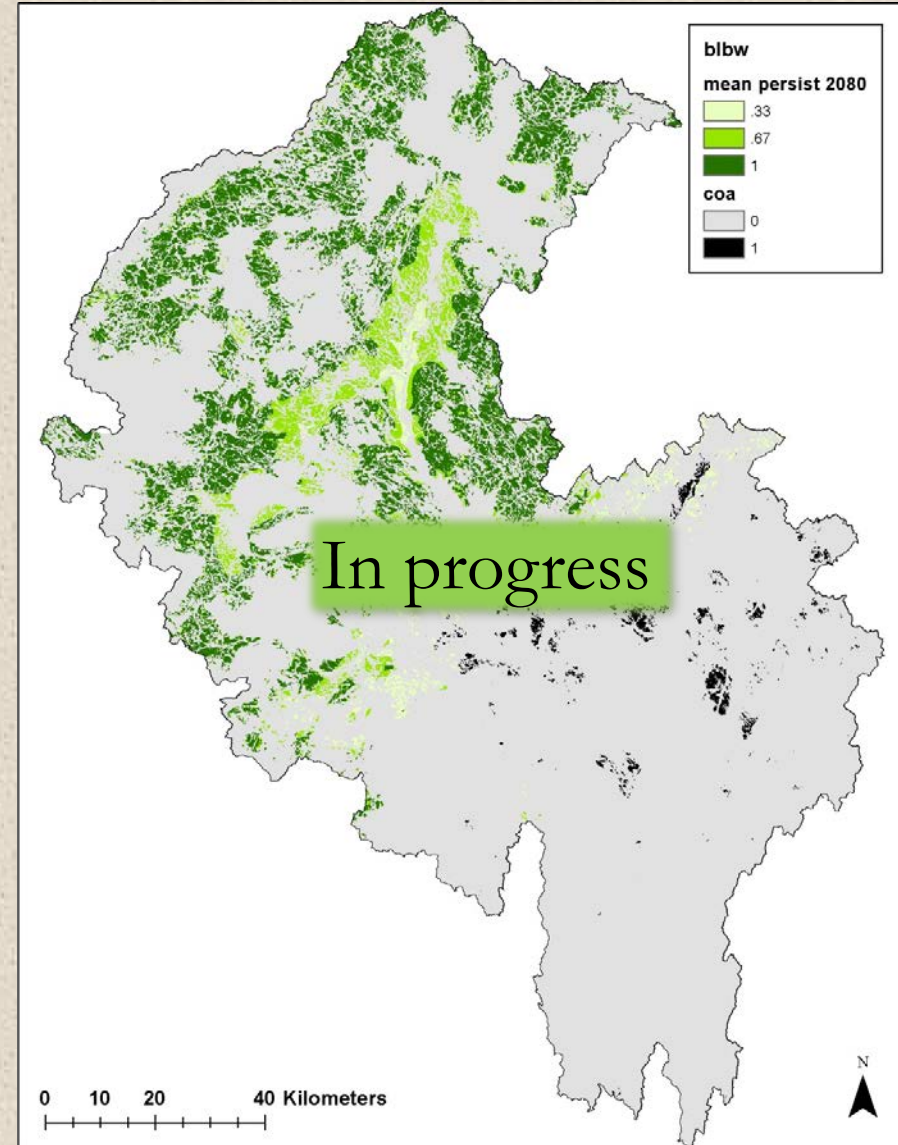

Wood thrush

Landscape Assessment

Species

- Landscape Change Vulnerability
 - *Climate vulnerability...*
proportional change in LC due to climate change
 - *Habitat vulnerability...*
proportional change in LC due to land use

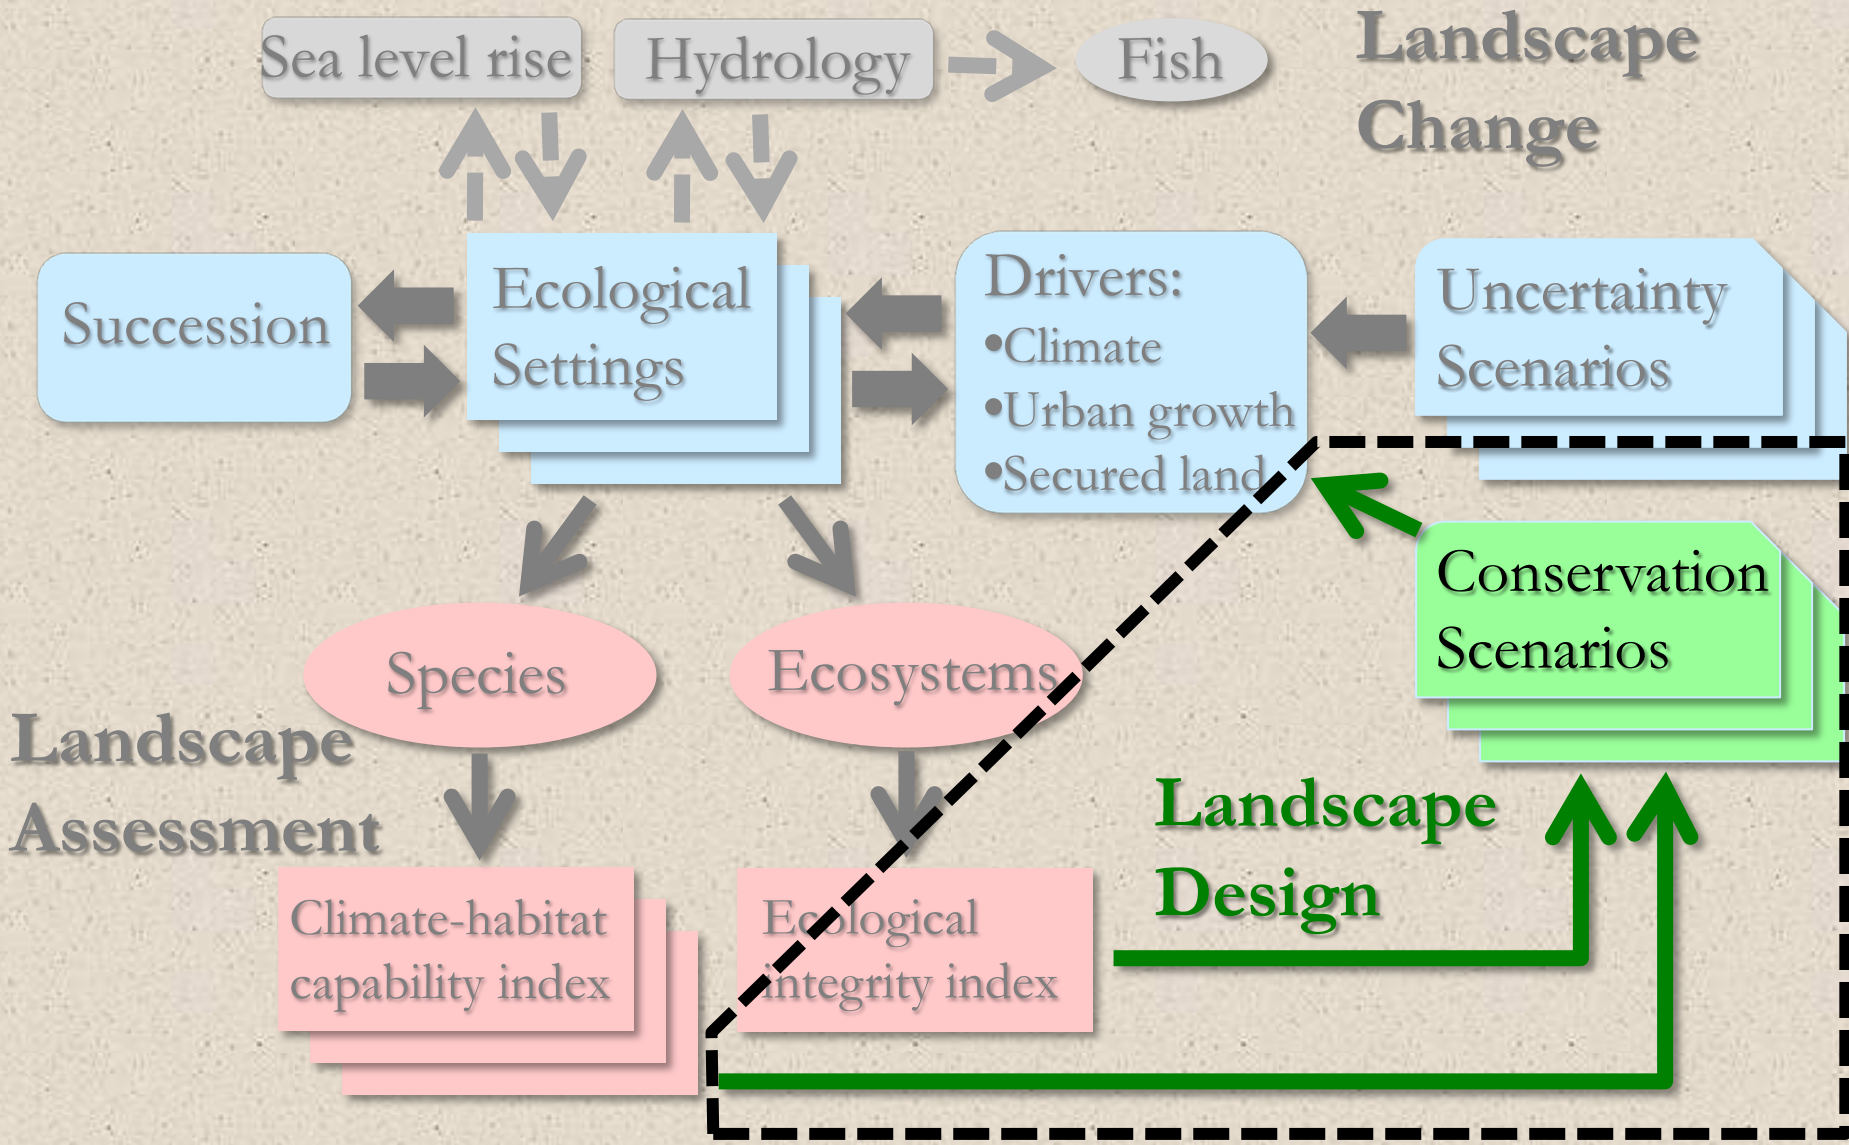

Landscape Assessment

Species

Representative species:

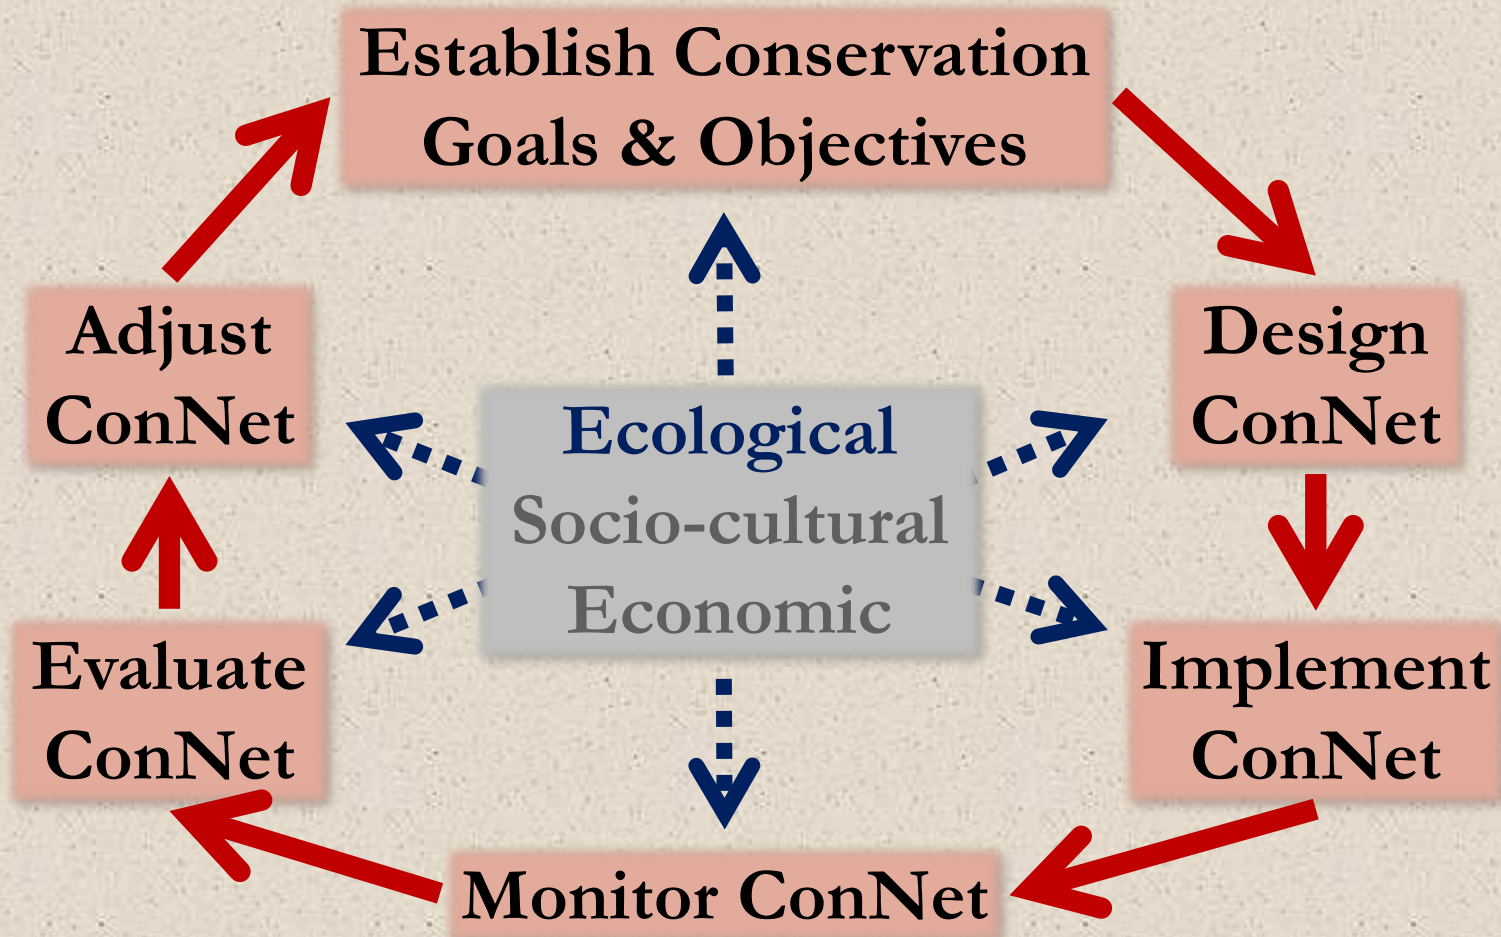

- American woodcock
- Black bear
- Blackburnian warbler
- Blackpoll warbler
- Brook trout*
- Eastern meadowlark
- Louisiana waterthrush
- Marsh wren
- Moose
- Northern waterthrush
- Ruffed grouse
- Wood duck
- Wood turtle
- Wood thrush
- American black duck (B)
- American black duck (NB)
- American oystercatcher
- Bicknell's thrush
- Box turtle
- Brown-headed nuthatch
- Cerulean warbler
- Common loon
- Diamondback terrapin
- Ovenbird
- Prairie warbler
- Red-shouldered hawk
- Saltmarsh sparrow
- Sanderling – migratory
- Snowshoe hare
- Snowy egret
- Virginia rail

LCAD Model

Landscape Conservation Design

Adaptive Landscape Conservation Design

Landscape Conservation Design

The Design Step

Design Steps:

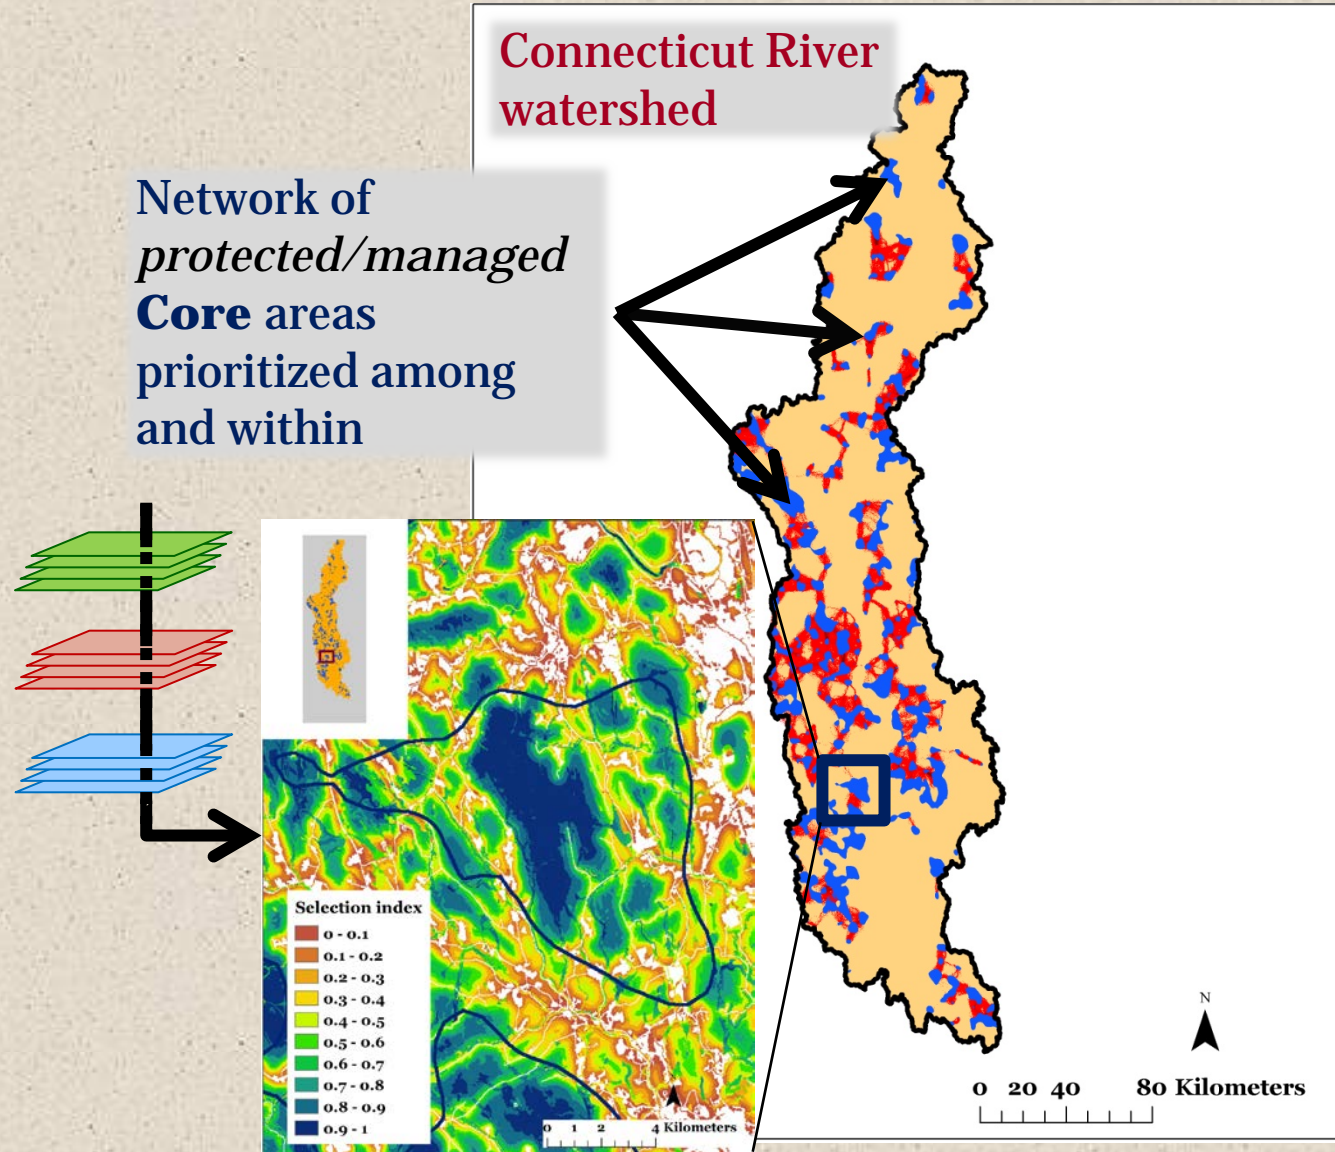

1. Select (tiered) *core* areas
2. Prioritize within/among cores
3. Create core area *buffers*
4. Delineate *corridors* among cores
5. Prioritize within/among corridors
6. Determine *management* needs
7. Identify *restoration* opportunities

- Field verification at all steps
- Socio-cultural and economic considerations at all steps

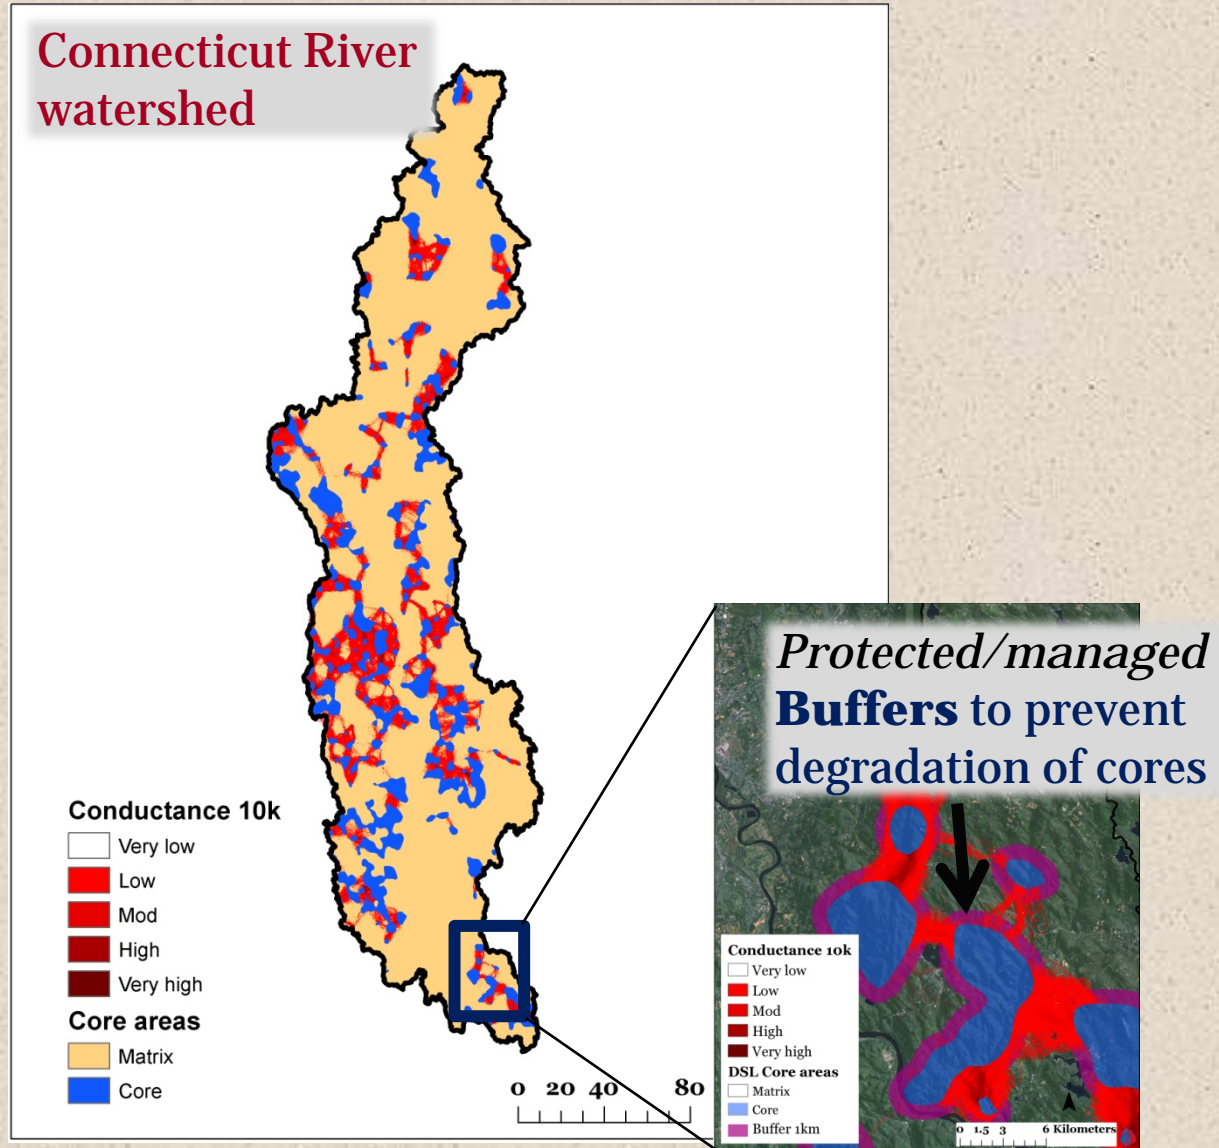

Landscape Conservation Design

What does it look like?

Landscape Conservation Design

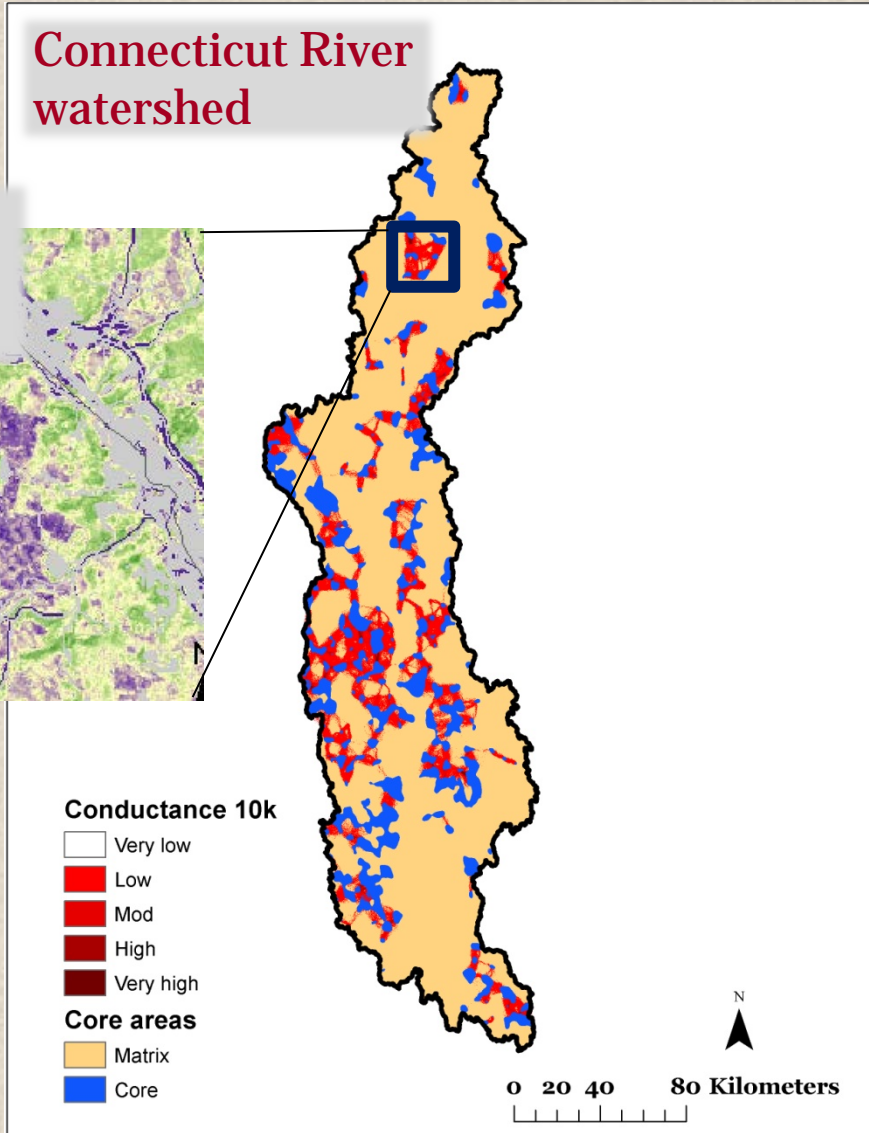

What does it look like?

Landscape Conservation Design

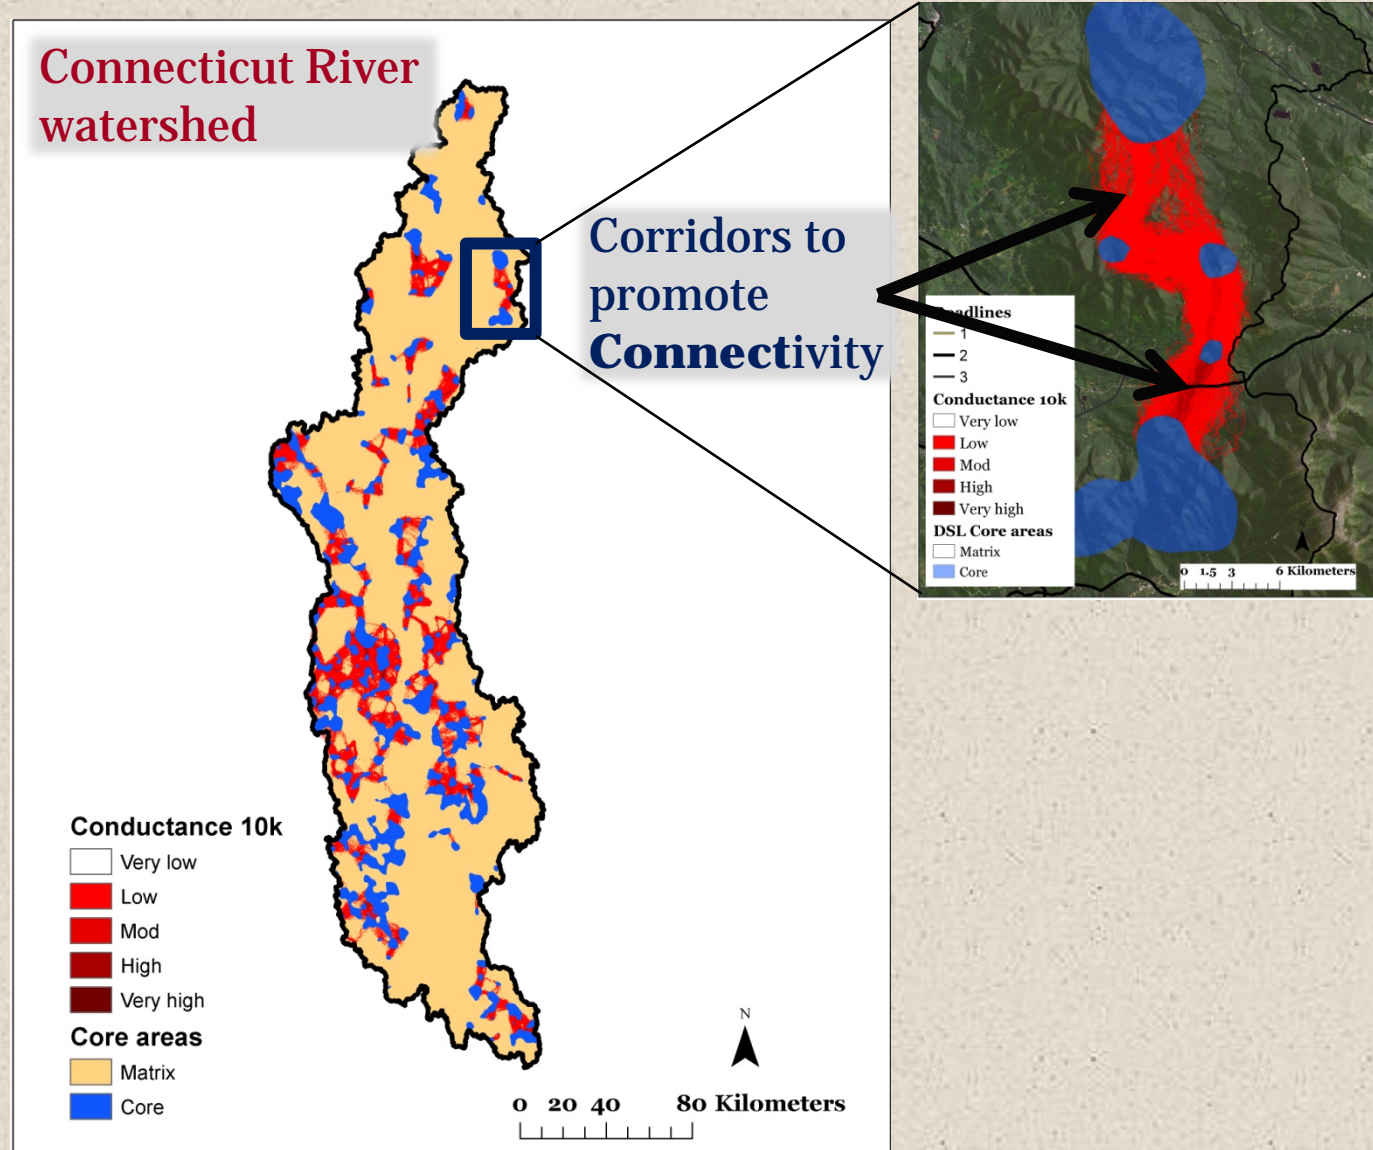

What does it look like?

Managed areas to create/maintain habitats (early seral)

Landscape Conservation Design

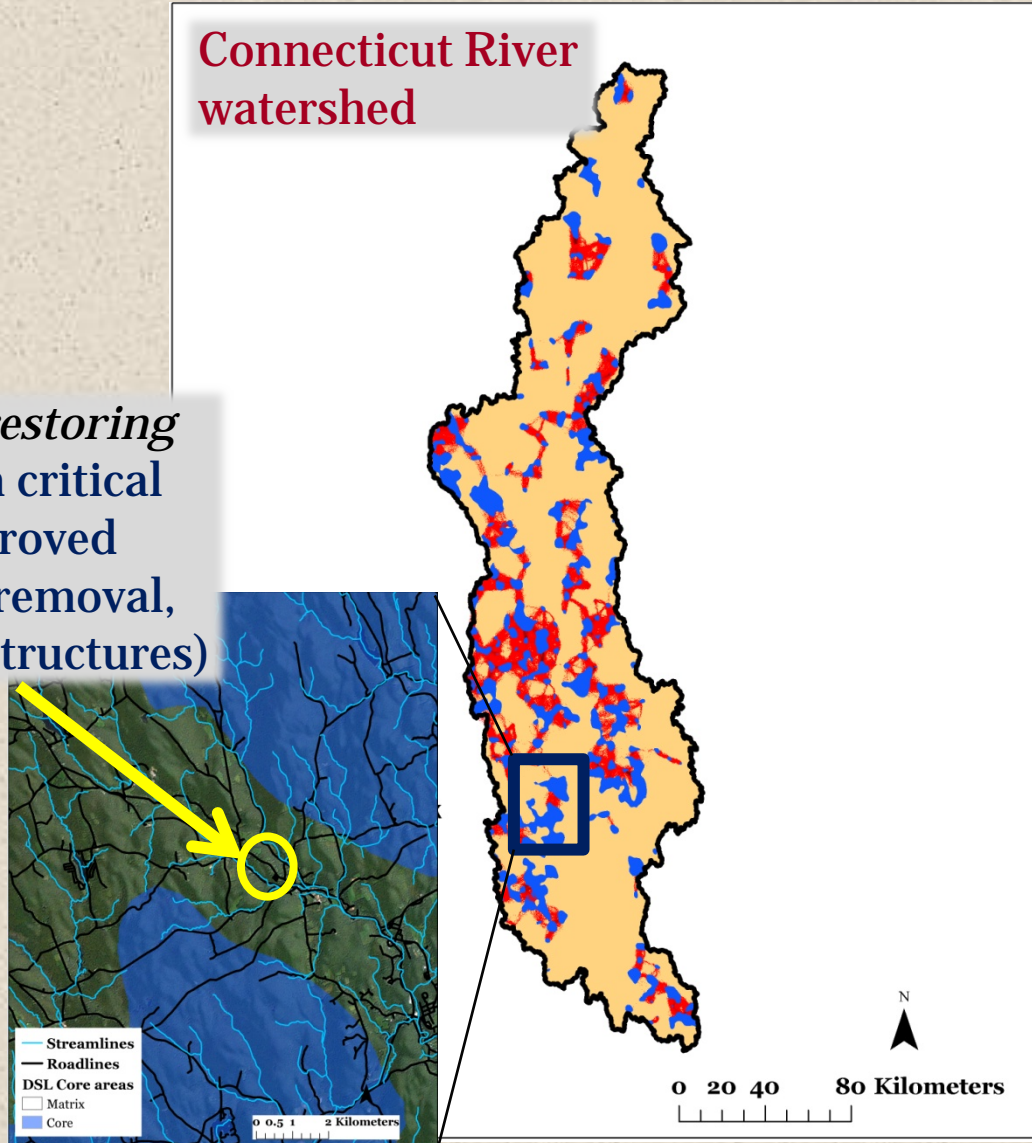

What does it look like?

Landscape Conservation Design

What does it look like?

Priorities for *restoring* connectivity in critical locations (improved culverts, dam removal, road passage structures)

Next Steps (phase 3)

1. Expand LCD to other landscapes
2. Develop DSS to facilitate interactive LCD
3. Improve coastal ecological integrity assessment
3. Improve landscape change model (e.g., timber harvest)
4. Improve spatial data inputs (e.g., development, culvert crossing scores)
5. Expand/improve integrity metrics (e.g., non-natives)
6. Improve integration with SLR and fisheries models
7. Expand scope to include marine environment
8. Improve species models
9. Run more change scenarios

Next Steps (phase 3)

1. LCD DSS

- Develop a stand alone software tool for LCD based on the process being piloted in the Connecticut River watershed
 - Integrates the DSL (and other) products in a way that best informs conservation design and makes it accessible to practitioners
- Staff required:
 - PI (4 weeks)
 - Compton (52 weeks)
 - Plunkett (30 weeks)
 - Grand (30 weeks)
 - Programmer (52 weeks)
 - Timeframe: 2 years in two phases
 - Budget: \$320k; \$160/year

Next Steps (phase 3)

2. Habitat management and restoration

a) Early seral habitat

- Compile spatial data on existing early seral management and create model for prioritizing early seral creation

■ Staff required:

- Compton (26 weeks)
- Plunkett (4 weeks)
- Grand (4 weeks)
- Deluca (26 weeks)

b) Agricultural conversion

- Create model to prioritize restoration of agricultural lands to wetland or forest

■ Timeframe: 1 or 2 years

- Budget: \$104k
(\$70k LCC)

Next Steps (phase 3)

3. Timber harvest

- Develop a timber harvest disturbance model
 - Low-end: Implement major treatment types by ownership/region/forest type within LCAD framework
 - High-end: fully integrate RMLands vegetation treatment model
- Staff required:
 - PI (2/4 weeks)
 - Compton (0/52 weeks)
 - Plunkett (26/32 weeks)
 - Grand (4/26 weeks)
 - Deluca (26/26 weeks)
 - Programmer (0/52 weeks)
 - Timeframe: 1 or 2 years
 - Budget:
 - \$100k/\$355k
 - (\$66k /\$320k LCC)

Designing Sustainable Landscapes in the Northeast

The overall purpose of this project (known colloquially as the **Designing Sustainable Landscapes** project, or **DSL** for short) is to assess the capability of current and potential future landscapes within the extent of the Northeast (13 states) to provide integral ecosystems and suitable habitat for a suite of focal (e.g., representative) species, and provide guidance for strategic habitat conservation. To meet this goal, we are developing a Landscape Change, Assessment and Design (LCAD) model, as described in the documents below. This project is largely supported by the North Atlantic Landscape Conservation Cooperative (NALCC), with additional support from the Northeast Climate Science Center (NECSC).

Manager Feedback and Questionnaire

This document is intended primarily for participants of the sub-regional workshops being held with partners of the North Atlantic Landscape Conservation Cooperative (NALCC) to review the results and provide feedback on phase 1 of the DSL project, although any NALCC partner is welcome to provide feedback. Specifically, this document includes a set of questions posed to partners concerning how best to package the landscape design information resulting from the Landscape Change, Assessment and Design (LCAD) model applied to the entire Northeast in phase 2.

Criteria for Feedback

The DSL project aims to provide regionally consistent information pertaining to biodiversity conservation planning and management across the Northeast. With this aim in mind, it is important to recognize the following criteria when providing feedback: 1). All LCAD data products must be regional (i.e., Northeast) in extent. There are lots of data that would be useful to LCAD, for example digital parcel land use zoning data, if they were available across the Northeast, but we are restricted to the use of digital data that are consistent across the Northeast. 2). Approaches for modeling landscape change, assessment and design must be technically feasible given available data and current computing resources. There may be ideal approaches that are not computationally feasible given available data and/or computing resources.

General topics

1) When the LCAD model is extended to the entire Northeast in phase 2, what is the best set of geographic ties (units) for rescaling ecological integrity and summarizing the model results?

- By state
- By watershed (indicated preferred HUC level in the comment box below)
- By ecoregion (indicated preferred ecoregion classification and level in the comment box below)
- Other (describe alternative tiling scheme in the comment box below)
